

Sealed SKF Explorer spherical roller bearings

Optimum protection against contaminants,
downtime and high maintenance costs

Contents

The SKF brand now stands for more than ever before, and means more to you as a valued customer.

While SKF maintains its leadership as a high-quality bearing manufacturer throughout the world, new dimensions in technical advances, product support and services have evolved SKF into a truly solutions-oriented supplier, creating greater value for customers.

These solutions enable customers to improve productivity, not only with breakthrough application-specific products, but also through leading-edge design simulation tools and consultancy services, plant asset efficiency maintenance programmes, and the industry's most advanced supply management techniques.

The SKF brand still stands for the very best in rolling bearings, but it now stands for much more.

Robust, economical and environmentally friendly

Sealed SKF Explorer spherical roller bearings provide distinct benefits

SKF Explorer spherical roller bearings are well-proven products on the market, having an attractive combination of design features such as self-alignment and very high load carrying capacity – features that make them irreplaceable in many demanding applications.

Sealed SKF Explorer spherical roller bearings have the same internal design as their open counterparts and have additional important features, distinct for both machine designers and end users.

Reduced need for maintenance

Sealed SKF Explorer spherical roller bearings are ready-to-use units that are filled, under clean conditions, at the factory with a proper amount of the correct grease. The bearings can extend service life considerably due to the cleanliness in the bearing cavity. As a result, many applications can be considered virtually maintenance-free.

Increased uptime and reliability

Cleanliness in a bearing is essential for long service life. Even very small particles can have a negative influence. By using sealed spherical roller bearings instead of open bearings, solid contaminants and moisture can be efficiently stopped from entering the bearing.

Grease savings

Contact seals on both sides of a bearing will keep grease where it is needed the most – inside the bearing.

In many cases, the grease service life is actually longer than the service life of the bearing or the application, making relubrication unnecessary.

Compact bearing arrangements

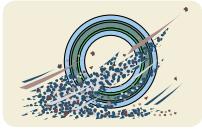

Sealed spherical roller bearings are especially suitable for bearing arrangements where, because of limited space or for cost reasons, effective external seals are not practical. The favourable design characteristics enable axial downsizing and therefore a more efficient and compact machine design.

Environmentally friendly

By reducing grease consumption, users of sealed spherical roller bearings can reduce the cost of buying and disposing of grease. But more importantly, these bearings can reduce the environmental impact that a machine will have while in service.

Enhanced efficiency in most industrial segments

Reliable

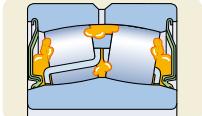

Sealed SKF Explorer spherical roller bearings provide a high degree of reliability in the most demanding applications. The integral seals retain the grease and protect the bearing from the ingress of contaminants during handling, mounting, and operation.

Industrial segments

- Metallurgy
- Mining and construction
- Fluid machinery
- Material handling
- Industrial gearboxes
- Textile industry
- Railways
- Energy

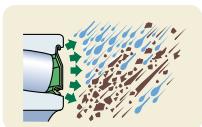

Typical customer requirements

- Long service life
- High load carrying capacity
- Compact arrangements
- Accommodate misalignment
- Minimum maintenance
- Low operating costs
- Few unplanned stops
- Environmental sustainability
- High availability
- Technical support

Lubricated

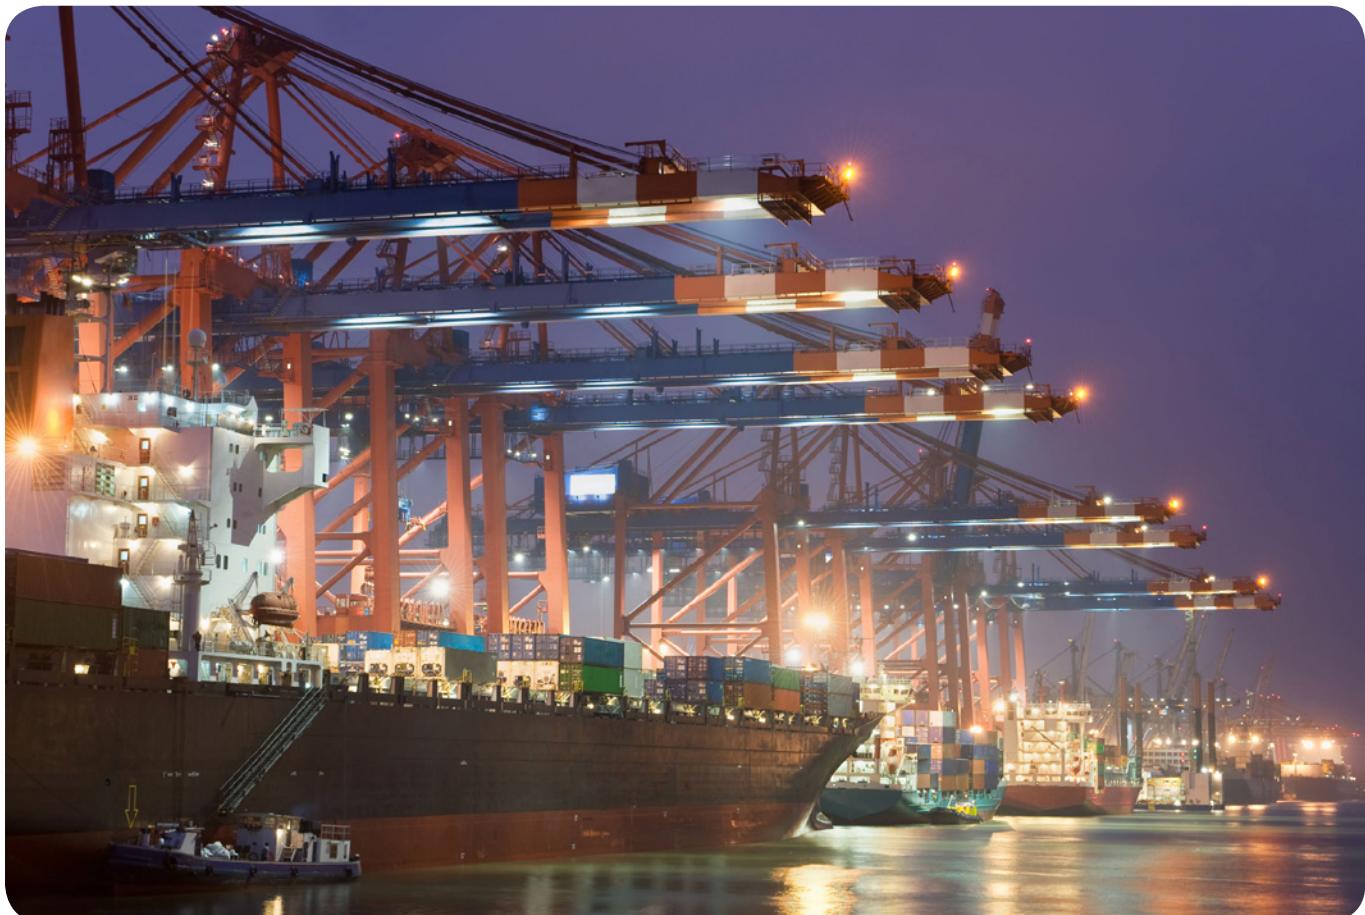

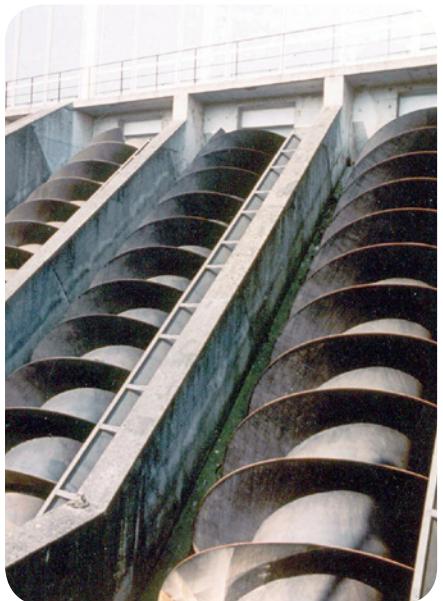

Bearings for normal operating temperatures and speeds are lubricated with SKF LGEP 2, a grease with a lithium thickener. The grease has excellent rust inhibiting properties.

Protected

The bearings are fitted with a double-lip seal on both sides. The seals are made of either acrylonitrile-butadiene rubber (NBR) or hydrogenated acrylonitrile-butadiene rubber (HNBR) and reinforced with sheet steel.

Selection of bearing size

Bearing life

The life-extending features embodied in sealed SKF Explorer spherical roller bearings can best be understood using the SKF rating life equation in accordance with ISO 281:1990/Amd 2:2000. The life can be expressed in

$$L_{nm} = a_1 a_{SKF} L_{10}$$

using the equation:

$$L_{nm} = a_1 a_{SKF} \left(\frac{C}{P} \right)^{10/3}$$

If the speed is constant, the life can best be expressed in operating hours using the equation:

$$L_{nmh} = a_1 a_{SKF} \frac{1\,000\,000}{60 n} \left(\frac{C}{P} \right)^{10/3}$$

where

- L_{nm} = SKF rating life at $(100 - n)\%$ reliability [millions of revolutions]¹⁾
- L_{nmh} = SKF rating life at $(100 - n)\%$ reliability [operating hours]¹⁾
- L_{10} = basic rating life at 90% reliability [millions of revolutions]
- a_1 = life adjustment factor for reliability (\rightarrow **table 1**)
- a_{SKF} = SKF life modification factor (\rightarrow **diagram 1**)
- C = basic dynamic load rating [kN]
- P = equivalent dynamic bearing load [kN]
- n = rotational speed [r/min]

The a_{SKF} factor

The a_{SKF} factor represents a very complex relationship between various influencing factors: the fatigue load limit ratio, contamination and lubrication. Values of the fatigue load limit (P_u) are provided in the product tables. Lubrication conditions are expressed by the viscosity ratio κ . Values of a_{SKF} can be obtained from **diagram 1** for different values of κ and the expression $\eta_c (P_u/P)$.

Diagram 1 includes a safety factor commonly used in fatigue life considerations and is valid for lubricants without EP additives. If a lubricant containing such additives is used, refer to the *SKF General Catalogue* or online at www.SKF.com.

Equivalent dynamic bearing load

The equivalent dynamic bearing load for spherical roller bearings can be obtained from

$$P = F_r + Y_1 F_a \text{ when } F_a/F_r \leq e$$

$$P = 0,67 F_r + Y_2 F_a \text{ when } F_a/F_r > e$$

where

- P = equivalent dynamic bearing load [kN]
- F_r = radial component of the bearing load [kN]
- F_a = axial component of the bearing load [kN]
- Y_1, Y_2 = axial load factors for the bearings
- e = calculation factor

Appropriate values for the factors e , Y_1 and Y_2 can be found in the product tables for each individual bearing.

Table 1

Values for life adjustment factor a_1

Reliability n ¹⁾	Failure probability	SKF rating life L_{nm}	Factor a_1
%	%	–	–
90	10	L_{10m}	1
95	5	L_{5m}	0,62
96	4	L_{4m}	0,53
97	3	L_{3m}	0,44
98	2	L_{2m}	0,33
99	1	L_{1m}	0,21

¹⁾ The factor n , to calculate L_{nm} and L_{nmh} , represents the failure probability, i.e. the difference between the requisite reliability and 100%

Table 2

Sealed versus open spherical roller bearings – a comparison

The performance enhancements incorporated into sealed SKF Explorer spherical roller bearings can best be demonstrated by comparing the calculated bearing life of a sealed spherical roller bearing BS2-2218-2CS/VT143 with a comparable open bearing 22218 E.

Both bearings have the same basic dynamic load rating C and fatigue load limit P_u .

$$C = 325 \text{ kN}$$

$$P_u = 39 \text{ kN}$$

The operating conditions are:

- Equivalent dynamic bearing load $P = 28,2 \text{ kN}$
- Viscosity ratio $\kappa = 2$
- Contamination factor $\eta_c = 0,7$ for the sealed bearing (\rightarrow table 2).
- Contamination factor $\eta_c = 0,4$ for the open bearing (\rightarrow table 2).

Life calculation for the sealed bearing:

Insert $\eta_c (P_u/P) = 0,7 \times 39/28,2 = 0,96$ on the horizontal scale in **diagram 1**. Move vertically to the intersection with the $\kappa = 2$ curve. This gives $a_{SKF} \approx 30,9$.

$$L_{10m} = a_{SKF}(C/P)^{10/3} = 3,09 \times (325/28,2)^{10/3}$$

$$L_{10m} = 106\,800 \text{ million revolutions}$$

Life calculation for the open bearing:

Insert $\eta_c (P_u/P) = 0,4 \times 39/28,2 = 0,55$ on the horizontal scale in **diagram 1**. Move vertically to the intersection with the $\kappa = 2$ curve. This gives $a_{SKF} \approx 7,1$.

$$L_{10m} = a_{SKF}(C/P)^{10/3} = 7,1 \times (325/28,2)^{10/3}$$

$$L_{10m} = 24\,500 \text{ million revolutions}$$

In this case, the rating life ratio between equivalent sealed and open bearings results in $106\,800/24\,500 = 4,4$. In other words, the life of the sealed bearing is more than four times longer than that of the open bearing.

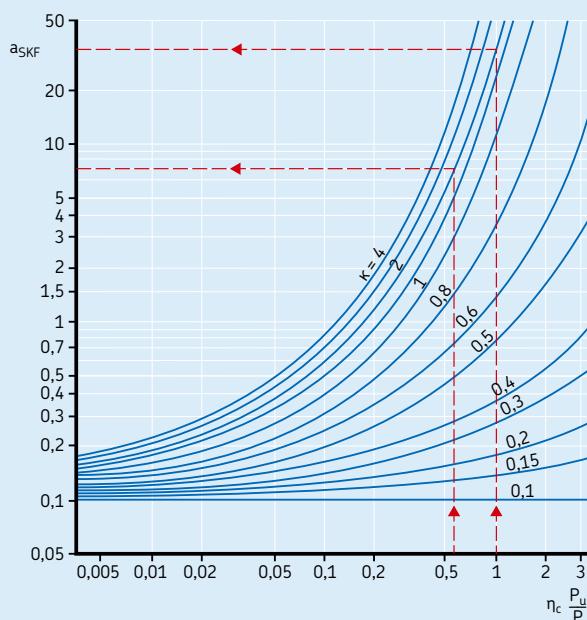

Guideline values for factor η_c for different levels of contamination

Condition	Factor $\eta_c^{(1)}$ for bearings with diameter	
	$d_m < 100 \text{ mm}$	$d_m \geq 100 \text{ mm}$
Extreme cleanliness Particle size of the order of the lubricant film thickness. Laboratory conditions	1	1
High cleanliness Oil filtered through an extremely fine filter. Conditions typical of relubrication-free sealed bearings	0,8 ... 0,6	0,9 ... 0,8
Normal cleanliness Oil filtered through a fine filter. Conditions typical of bearings greased for life and sealed	0,6 ... 0,5	0,8 ... 0,6
Slight contamination Slight contamination of the lubricant	0,5 ... 0,3	0,6 ... 0,4
Typical contamination Typical conditions for bearings without integral seals, where contamination levels are normal	0,3 ... 0,1	0,4 ... 0,2
Severe contamination Bearing environment heavily contaminated and bearing arrangement with inadequate sealing	0,1 ... 0	0,1 ... 0
Very severe contamination Under extreme contamination, values of η_c can be outside the scale resulting in a more severe reduction of life than predicted by the equation for L_{nm}	0	0

¹⁾ The scale for η_c refers only to solid contaminants. Water or other fluid contaminants detrimental to bearing service life are not included. In highly contaminated environments ($\eta_c = 0$), the bearing will fail prematurely due to excessive wear and will not attain the calculated bearing life.

Diagram 1

Factor a_{SKF} for SKF Explorer radial roller bearings

Bearing arrangement design

Abutment dimensions

Part of the range of sealed SKF spherical roller bearings have an extended width compared to corresponding open bearings. These bearings cannot replace standard open bearings without modifying the associated components in the application.

Due to the tapered seal land, the face diameter d_2 is smaller in sealed bearings than in corresponding open bearings (→ Product tables). When determining an abutment diameter d_a , the lower d_2 value for the sealed bearings must be taken into consideration (→ fig. 1).

Bearing space considerations

Sealed SKF spherical roller bearings are designed in such a way that the seals are positioned inside the side face plane. However, care must be taken so that nothing in the housing or on the shaft can interfere with the bearing seals during operation.

In applications where relubrication is necessary, there must be sufficient axial space (→ fig. 1) for the grease to purge through the seals. The axial space should be at least 10 times the maximum radial internal clearance value for the selected bearing (→ table 1, page 11).

The SKF three-barrier solution

The SKF three-barrier solution, which comprises a sealed spherical roller bearing, a housing with a 70 to 90% grease fill, and external labyrinth seals (→ fig. 2), is a very efficient sealing solution. Bearing arrangements with open bearings and contact seals can actually generate more friction than the SKF three-barrier solution. Using a sealed spherical roller bearing also means that the barrier grease used for filling the housing and the labyrinth seals is independent of the lubrication prerequisites of the bearing. Biodegradable greases can therefore be used. For additional information about the SKF three-barrier solution, contact the SKF Application engineering service.

IMPORTANT: There must be axial free space in the housing of a non-locating bearing or the bearing will be unable to move.

Fig. 1

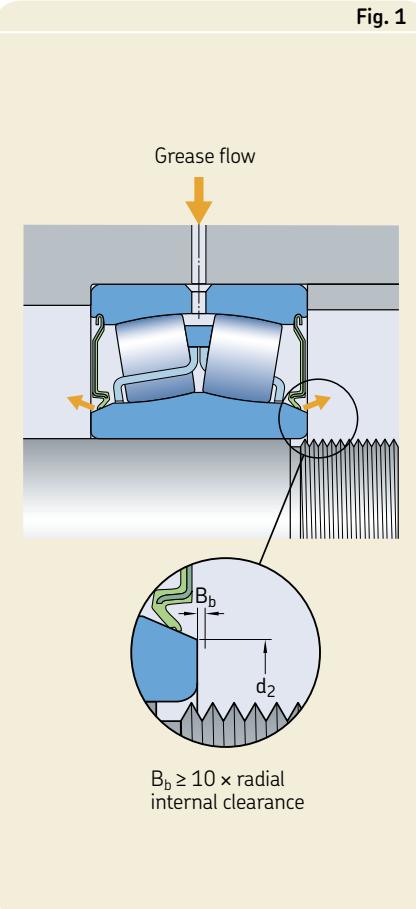

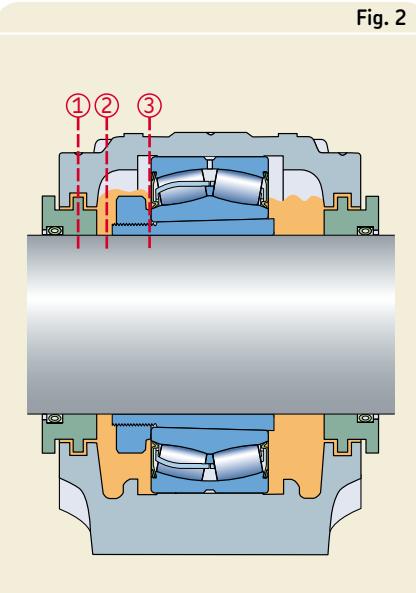

Fig. 2

Lubrication

B

The sealed spherical roller bearings shown in the product tables have, with two exceptions, an annular groove and three lubrication holes as standard. To prevent the ingress of contaminants, and to retain the grease in the bearing, a polymer band in the groove covers the lubrication holes of some smaller bearings (→ page 13).

If it is anticipated that bearing relubrication will be necessary during operation, the band should be removed before the bearing is mounted (→ fig. 1). When relubricating, grease should be applied slowly and with low pressure to the bearing as it rotates until fresh grease emerges from the sealing lips. Excess pressure should be avoided to prevent seal damage.

For additional information, see the *SKF Interactive Engineering Catalogue* online at www.skf.com/bearings.

Relubrication intervals

The same relubrication intervals should be used for sealed as for open bearings.

Because of their internal design, sealed SKF spherical roller bearings are able to accommodate heavy axial loads. However, if $F_a/F_r > e$ (→ product tables), more frequent relubrication is recommended.

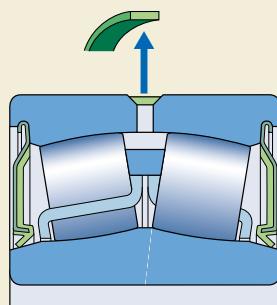

Fig. 1

Grease quantity for relubrication

Suitable quantities for replenishment can be obtained from

$$G_p = 0,0015 D B$$

where

G_p = grease quantity to be added when replenishing, g

D = bearing outside diameter, mm

B = bearing width, mm

- used 8 hours per day but not always fully utilized,
- normal operating conditions,
- horizontal shaft,

the bearing can be considered as virtually maintenance-free when

- the speed is less than 50% of the limiting speed, and
- the operating temperature does not exceed 70 °C (160 °F).

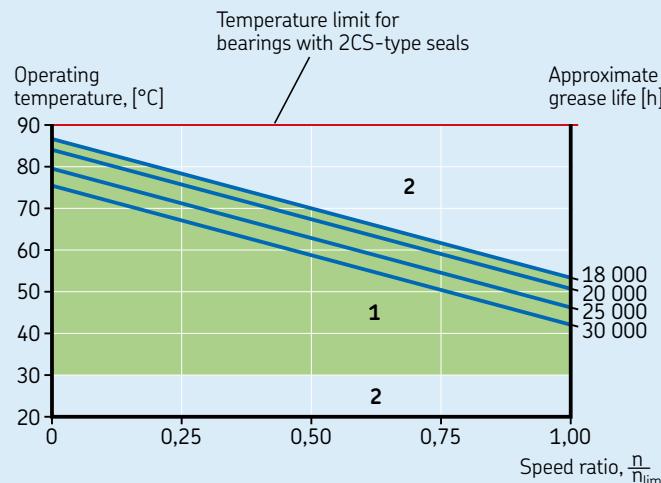

The green area in **diagram 1** illustrates the operating conditions where sealed spherical roller bearings are virtually maintenance-free.

The rule of thumb for maintenance-free

For general purpose applications categorized according to the *General Catalogue 6000*, page 72:

Diagram 1

The maintenance-free rule of thumb – valid for bearings with standard grease (suffix VT143)

1 Application area where bearings are virtually maintenance-free.

2 Application area where, based on certain specific conditions, bearings can be considered virtually maintenance-free.

Mounting and dismounting

Mounting

When mounting sealed spherical roller bearings it is important not to subject the bearings to excessive misalignment. If there is a considerable moment load imposed on the seals via the rollers or cages, there is a risk that the seals may be dislodged or damaged.

Bearings with a cylindrical bore

Sealed bearings with a cylindrical bore can be heated with an induction heater and hot mounted or pressed onto the shaft with a mounting dolly.

SKF does not recommend heating sealed bearings above 80 °C (175 °F). However, if higher temperatures are necessary, make sure that the temperature does not exceed the permissible temperature of either the seal or grease, whichever is lowest.

SKF does not recommend using a heating plate. However, if using a heating plate is unavoidable, the seal should not make contact with the plate. Appropriate distance washers should be used.

SKF recommends using KMFE lock nuts for the axial location of sealed spherical roller bearings (→ pages 13 to 15). These nuts provide the proper free space for the grease to escape when relubricating the bearings (→ fig. 1, page 8 and fig. 1). The alternative is to use a standard nut and lock washer. In this case, however, a spacer must be fitted between the lock washer and the inner ring. The width of the spacer has to match the axial free space condition, not to hinder the escape of grease (→ fig. 1, page 8).

Bearings with a tapered bore

When mounting sealed spherical roller bearings with a tapered bore, the expansion of the inner ring cannot be measured using feeler gauges.

Therefore, SKF recommends using the SKF Drive-up method for reliable and easy drive-up. General information is available at www.skf.com/mount.

If the SKF Drive-up method is not an option, the traditional drive-up method with a hook spanner and angle measurement is recommended. Additional information is available in the online library at www.skf.com.

Mounting on an adapter sleeve

Adapter sleeves facilitate mounting and dismounting and generally simplify the arrangement design (→ fig. 2a).

For bearings that need to be axially positioned, it is preferable to use a withdrawal sleeve (→ fig. 2b). However, if an adapter sleeve is to be used, it is preferable to use a support ring (→ fig. 2c).

Some bearings have a relatively small radial space for the support ring and should therefore not be subjected to a heavier axial load than the adapter sleeve can accommodate. (→ www.skf.com/bearings).

Note that the bore chamfer radius $r_{1,2\min}$ for sealed spherical roller bearings with a tapered bore differs from bearings with a cylindrical bore. See page 12, table 2.

Dismounting

The general recommendations at www.skf.com/bearings are valid also for sealed spherical roller bearings.

If the sealed bearing is to be reused, care should be taken to avoid damaging the seal.

Fig. 1

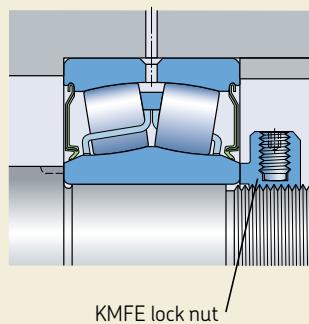

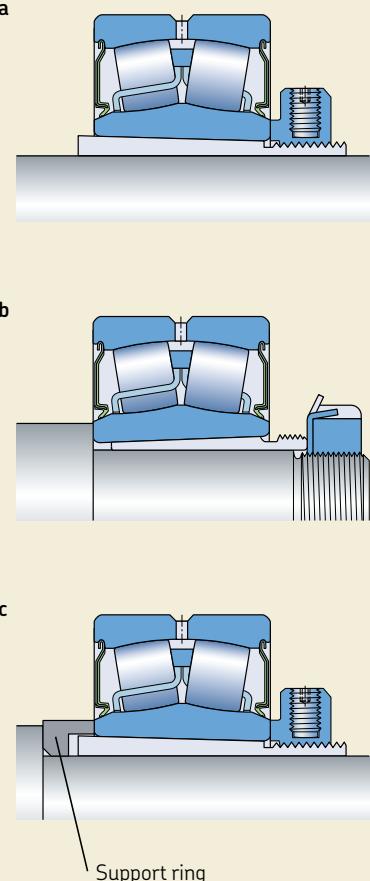

Fig. 2

Bearing data – general

C

Performance class

All sealed SKF spherical roller bearings belong to the SKF Explorer high performance class.

Cylindrical or tapered bore

Sealed SKF spherical roller bearings are available with either a cylindrical or tapered bore. The tapered bore is 1:12.

Annular groove and lubrication holes

To facilitate relubrication, all sealed SKF spherical roller bearings, with the exception of three sizes, have an annular groove and three lubrication holes in the outer ring, as standard.

Dimensions

The boundary dimensions of sealed SKF spherical roller bearings are in accordance with ISO 15:1998, except for the width of sealed bearings in the BS2- series.

Tolerances

Standard SKF spherical roller bearings are manufactured to a higher precision than the ISO Normal tolerances:

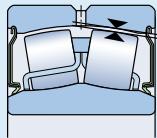

- The width tolerance is considerably tighter than the ISO Normal tolerance.
- The running accuracy is to P5 tolerance class.

Internal clearance

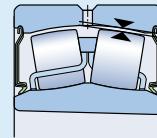

Standard sealed spherical roller bearings from SKF are manufactured with Normal radial internal clearance. Nearly all the bearings are also available with a larger C3 internal clearance and some can be supplied with an even larger C4 clearance. Some sizes are available with C2 internal clearance, which is smaller than Normal. Before ordering, contact SKF for availability of bearings with radial internal clearance other than Normal. The various radial internal clearances are in accordance with ISO 5753:1991 and listed in **table 1**. They are valid for zero measuring load prior to mounting.

Misalignment

The design of sealed SKF spherical roller bearings is such that they are inherently self-aligning, i.e. the bearings can accommodate angular misalignment of the shaft relative to the housing without any negative effect on bearing performance.

Under operating conditions where the misalignment is constant relative to the outer ring, sealed SKF spherical roller bearings can accommodate angular misalignment of the shaft relative to the housing of up to 0.5° with no detrimental effect on the efficiency of the seals.

When misalignment is not constant with respect to the bearing outer ring (\rightarrow fig. 1), the bearing friction increases and therefore the misalignment of the inner ring relative to the outer ring should not exceed a few tenths of a degree.

Influence of operating temperature on the bearing materials

The temperature that a sealed spherical roller bearing can accommodate is limited by the grease and seal material.

- Bearings with suffix 2CS/VT143 should not be used at operating temperatures above $+90^\circ\text{C}$ (194°F).
- Bearings with suffix 2CS2/VT143 or 2CS5/VT143 should not be used at operating temperatures above $+110^\circ\text{C}$ (230°F).

Axial load carrying capacity

Because of their internal design, sealed SKF spherical roller bearings are able to accommodate heavy axial loads. However, if $F_a/F_r > e$ (\rightarrow product tables), more frequent lubrication is recommended.

Speed ratings

The speed rating of sealed spherical roller bearings is limited by the friction generated in the seal contacts. Accordingly, only the limiting speed is listed in the product tables. The limiting speed for sealed spherical roller bearings is roughly 25% of the reference speed of open bearings.

Seal materials

Depending on the size, sealed SKF spherical roller bearings are fitted with seals made of one of the following materials:

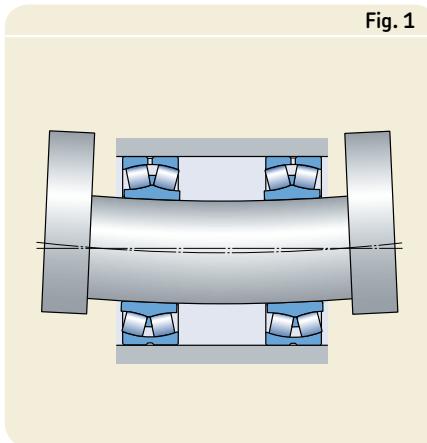

Fig. 1

WARNING!

Safety precautions for fluoro rubber

Fluoro rubber is very stable and harmless under normal operating conditions up to $+200^\circ\text{C}$. However, if exposed to extreme temperatures above 300°C , e.g. fire or the flame of a cutting torch, fluoro rubber seals give off hazardous fumes. These fumes can be harmful if inhaled, as well as to the eyes. In addition, once the seals have been heated to such temperatures, they are dangerous to handle even after they have cooled and should not be in contact with the skin. If it is necessary to handle bearings with seals that have been subjected to high temperatures, such as when dismounting the bearing, the following safety precautions should be observed:

- Always wear protective goggles, gloves and an appropriate breathing apparatus.
- Place the remains of the seals in an airtight plastic container marked with a symbol for "material will etch".
- Follow the safety precautions in the appropriate material safety data sheet (MSDS).

If there is unintentional contact with the seals, wash hands with soap and plenty of water and flush eyes with plenty of water and consult a doctor immediately. If the fumes have been inhaled, consult a doctor immediately.

The user is responsible for the correct use of the product during its service life and its proper disposal. SKF takes no responsibility for the improper handling of fluoro rubber seals or for any injury resulting from their use.

Table 2

Bore chamfer radii for bearings with a cylindrical bore or a tapered bore

Cylindrical bore $r_{1,2\min}$	Tapered bore $r_{1,2\min}$
1,0 to 1,1	→ 0,6

4,0	→ 1,5
5,0	→ 2,0
6,0	→ 3,0

- acrylonitrile-butadiene rubber (NBR), designation suffix CS
- hydrogenated acrylonitrile-butadiene rubber (HNBR), designation suffix CS5,
- fluoro-elastomer (FKM), designation suffix CS2. This material is being replaced by HNBR.

Supplementary data

A practical overview of the sealed bearing assortment including individual design differences, relubrication data and appropriate accessories, is shown in the supplementary data table on **page 13 to 15**.

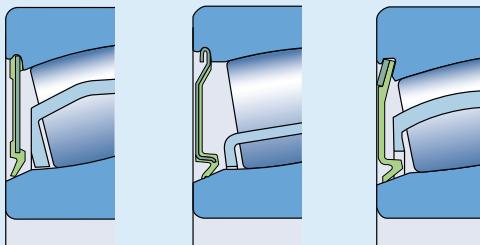

The bore chamfer radius $r_{1,2\min}$ listed in the product table is valid for bearings with a cylindrical bore. The corresponding values for bearings with a tapered bore are listed in **table 2**.

Designations

There are two designation modes for sealed SKF Explorer spherical roller bearings. See overview on **page 16 to 17**.

Designations

There are two designation modes for sealed SKF Explorer spherical roller bearings. One identifies sealed bearings in the standard ISO dimension series. The other mode identifies sealed bearings that are wider than the ISO specification.

Bearings with principal dimensions according to ISO standard (Example: 24026-2CS5/VT143)

xxxxx-2CSx/xxxx

Basic designation

Standard five-digit basic designation as for open bearings.

Seals

2CS Acrylonitrile-butadiene rubber (NBR) seal on both sides.

Outer ring with relubrication features.

2CS5

Hydrogenated acrylonitrile-butadiene rubber (HNBR) seal on both sides.

Outer ring with relubrication features.

2CS2

Fluoroelastomer (FKM) seal on both sides. **WARNING:** See safety message on page 12.

Outer ring with relubrication features.

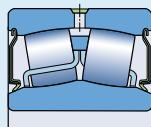

Lubricant

VT143

Filled to 25 to 45% with LGEP 2 grease.

See also *Supplementary suffixes*.

Bearings with extended width (Example: BS2-2222-2CS5/VT143)

BS2-xxxx-2CSx/xxxx

Basic designation

Spherical roller bearing with two rows of rollers.

The two initial digits denote the dimension series and the two last digits the bore diameter divided by 5.

Seals

2CS

Acrylonitrile-butadiene rubber (NBR) seal on both sides.

Outer ring with relubrication features.

2CS5

Hydrogenated acrylonitrile-butadiene rubber (HNBR) seal on both sides.

Outer ring with W33 groove and holes.

2CS2

Fluoroelastomer (FKM) seal on both sides. **WARNING:** See safety message on page 12.

Outer ring with W33 groove and holes.

Lubricant

VT143

Filled to 25 to 45% with LGEP 2 grease.

See also *Supplementary suffixes*.

Suffixes in product tables

2CS	Bearing sealed on both sides. Seal material: Acrylonitrile-butadiene rubber (NBR). Outer ring with W33 groove and holes.
2CS2	Bearing sealed on both sides. Seal material: Fluoroelastomer (FKM). Outer ring with W33 groove and holes.
2CS5	Bearing sealed on both sides. Seal material: Hydrogenated acrylonitrile-butadiene rubber (HNBR). Outer ring with W33 groove and holes.
K	Tapered bore. Taper 1:12
VT143	Filled to 25 to 45% with LGEP 2 grease. The filling degree depends on bearing size.
W	Bearing without W33 groove and holes in the outer ring.

Supplementary suffixes

CS	Bearing sealed on one side Seal material: Acrylonitrile-butadiene rubber (NBR). Outer ring with W33 groove and holes
CS5	Bearing sealed on one side Seal material: Hydrogenated acrylonitrile-butadiene rubber (HNBR). Outer ring with W33 groove and holes
C3	Radial internal clearance greater than Normal
C4	Radial internal clearance greater than C3
GEM9	Filled to 70 to 100% with LGHB 2 grease
VT143B	Filled to 45 to 60% with LGEP 2 grease
VT143C	Filled to 70 to 100% with LGEP 2 grease

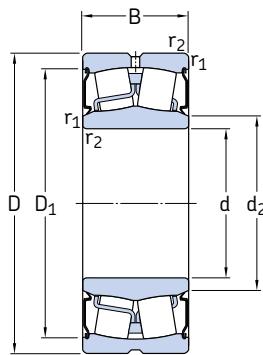

C

Former versus new suffixes

Former suffix	New suffix
xxxxx-2CS (Grease specification included in the 2CS suffix)	replaced by xxxxx-2CS/VT143 (Grease specification not included in the 2CS suffix. Instead it is included in the VT143 suffix)
xxxxx-2CS5 (Grease specification included in the 2CS5 suffix)	replaced by xxxxx-2CS5/GEM9 (Grease specification not included in the 2CS5 suffix. Instead it is included in the GEM9 suffix)

Sealed SKF Explorer spherical roller bearings

¹⁾ Valid for bearings with a cylindrical bore only. Corresponding values for bearings with a tapered bore are listed on page 12, table 2.

SKF – the knowledge engineering company

From the company that invented the self-aligning ball bearing more than 100 years ago, SKF has evolved into a knowledge engineering company that is able to draw on five technology platforms to create unique solutions for its customers. These platforms include bearings, bearing units and seals, of course, but extend to other areas including: lubricants and lubrication systems, critical for long bearing life in many applications; mechatronics that combine mechanical and electronics knowledge into systems for more effective linear motion and sensorized solutions; and a full range of services, from design and logistics support to condition monitoring and reliability systems.

Though the scope has broadened, SKF continues to maintain the world's leadership in the design, manufacture and marketing of rolling bearings, as well as complementary products such as radial seals. SKF also holds an increasingly important position in the market for linear motion products, high-precision aerospace bearings, machine tool spindles and plant maintenance services.

The SKF Group is globally certified to ISO 14001, the international standard for environmental management, as well as OHSAS 18001, the health and safety management standard. Individual divisions have been approved for quality certification in accordance with ISO 9001 and other customer specific requirements.

With over 100 manufacturing sites worldwide and sales companies in 70 countries, SKF is a truly international corporation. In addition, our distributors and dealers in some 15 000 locations around the world, an e-business marketplace and a global distribution system put SKF close to customers for the supply of both products and services. In essence, SKF solutions are available wherever and whenever customers need them. Overall, the SKF brand and the corporation are stronger than ever. As the knowledge engineering company, we stand ready to serve you with world-class product competencies, intellectual resources, and the vision to help you succeed.

Evolving by-wire technology

SKF has a unique expertise in the fast-growing by-wire technology, from fly-by-wire, to drive-by-wire, to work-by-wire. SKF pioneered practical fly-by-wire technology and is a close working partner with all aerospace industry leaders. As an example, virtually all aircraft of the Airbus design use SKF by-wire systems for cockpit flight control.

SKF is also a leader in automotive by-wire technology, and has partnered with automotive engineers to develop two concept cars, which employ SKF mechatronics for steering and braking. Further by-wire development has led SKF to produce an all-electric forklift truck, which uses mechatronics rather than hydraulics for all controls.

Harnessing wind power

The growing industry of wind-generated electric power provides a source of clean, green electricity. SKF is working closely with global industry leaders to develop efficient and trouble-free turbines, providing a wide range of large, highly specialized bearings and condition monitoring systems to extend equipment life of wind farms located in even the most remote and inhospitable environments.

Working in extreme environments

In frigid winters, especially in northern countries, extreme sub-zero temperatures can cause bearings in railway axleboxes to seize due to lubrication starvation. SKF created a new family of synthetic lubricants formulated to retain their lubrication viscosity even at these extreme temperatures. SKF knowledge enables manufacturers and end user customers to overcome the performance issues resulting from extreme temperatures, whether hot or cold. For example, SKF products are at work in diverse environments such as baking ovens and instant freezing in food processing plants.

Developing a cleaner cleaner

The electric motor and its bearings are the heart of many household appliances. SKF works closely with appliance manufacturers to improve their products' performance, cut costs, reduce weight, and reduce energy consumption. A recent example of this cooperation is a new generation of vacuum cleaners with substantially more suction. SKF knowledge in the area of small bearing technology is also applied to manufacturers of power tools and office equipment.

Maintaining a 350 km/h R&D lab

In addition to SKF's renowned research and development facilities in Europe and the United States, Formula One car racing provides a unique environment for SKF to push the limits of bearing technology. For over 60 years, SKF products, engineering and knowledge have helped make Scuderia Ferrari a formidable force in F1 racing. (The average racing Ferrari utilizes around 150 SKF components.) Lessons learned here are applied to the products we provide to automakers and the aftermarket worldwide.

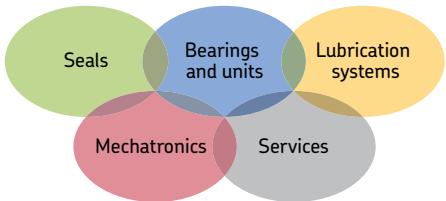

Delivering Asset Efficiency Optimization

Through SKF Reliability Systems, SKF provides a comprehensive range of asset efficiency products and services, from condition monitoring hardware and software to maintenance strategies, engineering assistance and machine reliability programmes. To optimize efficiency and boost productivity, some industrial facilities opt for an Integrated Maintenance Solution, in which SKF delivers all services under one fixed-fee, performance-based contract.

Planning for sustainable growth

By their very nature, bearings make a positive contribution to the natural environment, enabling machinery to operate more efficiently, consume less power, and require less lubrication. By raising the performance bar for our own products, SKF is enabling a new generation of high-efficiency products and equipment. With an eye to the future and the world we will leave to our children, the SKF Group policy on environment, health and safety, as well as the manufacturing techniques, are planned and implemented to help protect and preserve the earth's limited natural resources. We remain committed to sustainable, environmentally responsible growth.

The Power of Knowledge Engineering

Drawing on five areas of competence and application-specific expertise amassed over more than 100 years, SKF brings innovative solutions to OEMs and production facilities in every major industry worldwide. These five competence areas include bearings and units, seals, lubrication systems, mechatronics (combining mechanics and electronics into intelligent systems), and a wide range of services, from 3-D computer modelling to advanced condition monitoring and reliability and asset management systems. A global presence provides SKF customers uniform quality standards and worldwide product availability.
