Foreword

The SKF brand now stands for more than ever before, and means more to you as a valued customer.

While SKF maintains its leadership as the hallmark of quality bearings throughout the world, new dimensions in technical advances, product support and services have evolved SKF into a truly solutions-oriented supplier, creating greater value for customers.

These solutions encompass ways to bring greater productivity to customers, not only with breakthrough application-specific products, but also through leading-edge design simulation tools and consultancy services, plant asset efficiency maintenance programmes, and the industry's most advanced supply management techniques.

The SKF brand still stands for the very best in rolling bearings, but it now stands for much more.

SKF – the knowledge engineering company

This publication provides information on all the SKF Actuation System products with clear tables to help the customer select and order the right product.

Structure of the catalogue

This catalogue is divided into nine main chapters, marked with numbered blue tabs in the right margin:

- Chapter 1 provides technical and application recommendations.
- Chapter 2 describes the different telescopic pillars.
- Chapter 3 presents the linear actuator series.
- Chapter 4 displays data about rotary actuators.
- Chapter 5 and 6 contain information about control units and accessories.
- Chapter 7 gives a brief description of products dedicated to project sales.
- Chapter 8 introduces the Electronic Parking Brake by Drive by Wire.
- Chapter 9 lists the different spare parts and accessories.

About the data in this catalogue

The data in this catalogue relate to SKF's state-of-the-art technology and production capabilities as of 2010. The data may differ from that presented in earlier catalogues because of redesign, technological developments, or revised methods of calculation. SKF reserves the right to make continuing improvements to SKF products regarding materials, design and manufacturing methods, as well as changes necessitated by technological developments.

How to use this catalogue

Each product is introduced by providing information such as technical data, dimensional drawings or connecting diagrams, in order to make it easy to select the right product.

At the end of each product information section, an ordering key is shown.

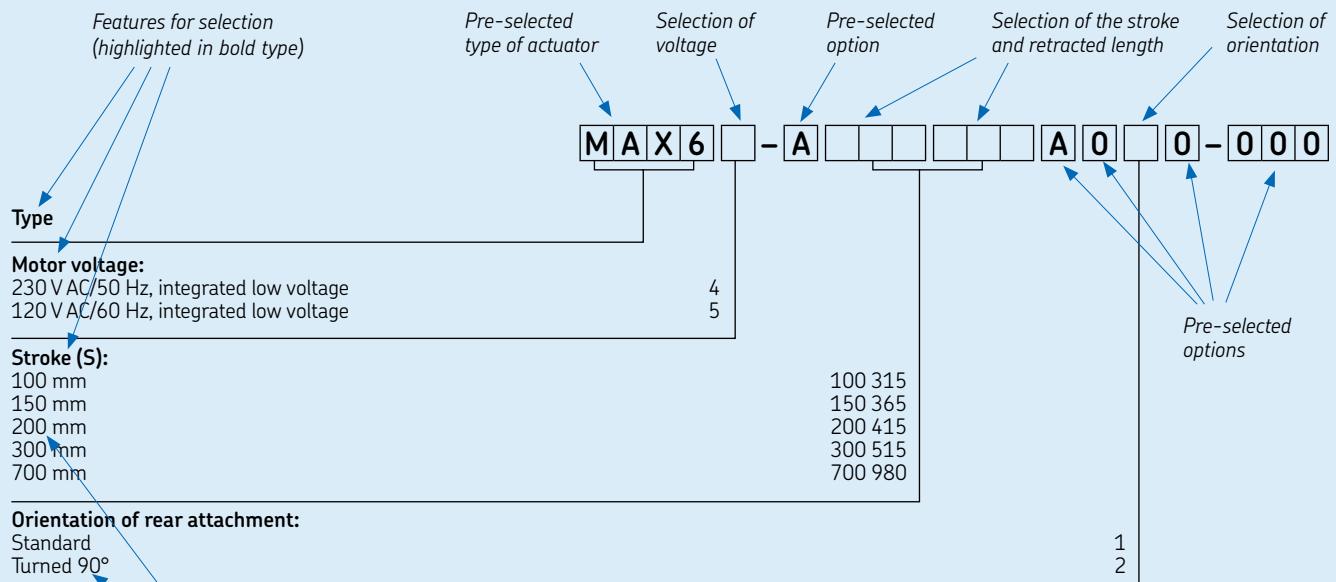

To determine the product code to be used on the order, examine the relevant pages containing the main data and prepare the order code. This may consist of pre-set options, ordering key boxes already filled in (for example: type, color, etc.) and options that can be selected from several empty boxes (for example: voltage and stroke length). In the ordering key, the options are set out under the associated subjects, with the code or the information to be entered indicated along with the measurement restrictions contained in the associated tables. The sequence of the ordering key is defined by the thin guiding lines that select the corres-

ponding box. The individual ordering key may contain indications or special notes.

For the CAT series, the selection of the item's dynamic load/speed and motor option should be made by use of an additional table with several options located above the ordering key.

An example is given below to show how to prepare the order code for a MAX 6 linear actuator.

NOTE: See product specific catalogues at www.actuators.skf.com for more complete information and descriptions of the various products briefly described in this catalogue.

Options, alphanumeric identity code of the required item, are to be written in the corresponding box of the ordering key

Example

M A X 6 4 - A 1 0 0 3 1 5 A 0 1 0 - 0 0 0

Example of an ordering key that has been filled in

SKF – the knowledge engineering company

From the company that invented the self-aligning ball bearing more than 100 years ago, SKF has evolved into a knowledge engineering company that is able to draw on five technology platforms to create unique solutions for its customers. These platforms include bearings, bearing units and seals, of course, but extend to other areas including: lubricants and lubrication systems, critical for long bearing life in many applications; mechatronics that combine mechanical and electronics knowledge into systems for more effective linear motion and sensorized solutions; and a full range of services, from design and logistics support to condition monitoring and reliability systems.

Though the scope has broadened, SKF continues to maintain the world's leadership in the design, manufacture and marketing of rolling bearings, as well as complementary products such as radial seals. SKF also holds an increasingly important position in the market for linear motion products, high-precision aerospace bearings, machine tool spindles and plant maintenance services.

The SKF Group is globally certified to ISO 14001, the international standard for environmental management, as well as OHSAS 18001, the health and safety management standard. Individual divisions have been approved for quality certification in accordance with ISO 9001 and other customer specific requirements.

With over 100 manufacturing sites worldwide and sales companies in 70 countries, SKF is a truly international corporation. In addition, our distributors and dealers in some 15 000 locations around the world, an e-business marketplace and a global distribution system put SKF close to customers for the supply of both products and services. In essence, SKF solutions are available wherever and whenever customers need them. Overall, the SKF brand and the corporation are stronger than ever. As the knowledge engineering company, we stand ready to serve you with world-class product competencies, intellectual resources, and the vision to help you succeed.

Evolving by-wire technology

SKF has a unique expertise in the fast-growing by-wire technology, from fly-by-wire, to drive-by-wire, to work-by-wire. SKF pioneered practical fly-by-wire technology and is a close working partner with all aerospace industry leaders. As an example, virtually all aircraft of the Airbus design use SKF by-wire systems for cockpit flight control.

SKF is also a leader in automotive by-wire technology, and has partnered with automotive engineers to develop two concept cars, which employ SKF mechatronics for steering and braking. Further by-wire development has led SKF to produce an all-electric forklift truck, which uses mechatronics rather than hydraulics for all controls.

Harnessing wind power

The growing industry of wind-generated electric power provides a source of clean, green electricity. SKF is working closely with global industry leaders to develop efficient and trouble-free turbines, providing a wide range of large, highly specialized bearings and condition monitoring systems to extend equipment life of wind farms located in even the most remote and inhospitable environments.

Working in extreme environments

In frigid winters, especially in northern countries, extreme sub-zero temperatures can cause bearings in railway axleboxes to seize due to lubrication starvation. SKF created a new family of synthetic lubricants formulated to retain their lubrication viscosity even at these extreme temperatures. SKF knowledge enables manufacturers and end user customers to overcome the performance issues resulting from extreme temperatures, whether hot or cold. For example, SKF products are at work in diverse environments such as baking ovens and instant freezing in food processing plants.

Developing a cleaner cleaner

The electric motor and its bearings are the heart of many household appliances. SKF works closely with appliance manufacturers to improve their products' performance, cut costs, reduce weight, and reduce energy consumption. A recent example of this cooperation is a new generation of vacuum cleaners with substantially more suction. SKF knowledge in the area of small bearing technology is also applied to manufacturers of power tools and office equipment.

Maintaining a 350 km/h R&D lab

In addition to SKF's renowned research and development facilities in Europe and the United States, Formula One car racing provides a unique environment for SKF to push the limits of bearing technology. For over 60 years, SKF products, engineering and knowledge have helped make Scuderia Ferrari a formidable force in F1 racing. (The average racing Ferrari utilizes around 150 SKF components.) Lessons learned here are applied to the products we provide to automakers and the aftermarket worldwide.

Delivering Asset Efficiency Optimization

Through SKF Reliability Systems, SKF provides a comprehensive range of asset efficiency products and services, from condition monitoring hardware and software to maintenance strategies, engineering assistance and machine reliability programmes. To optimize efficiency and boost productivity, some industrial facilities opt for an Integrated Maintenance Solution, in which SKF delivers all services under one fixed-fee, performance-based contract.

Planning for sustainable growth

By their very nature, bearings make a positive contribution to the natural environment, enabling machinery to operate more efficiently, consume less power, and require less lubrication. By raising the performance bar for our own products, SKF is enabling a new generation of high-efficiency products and equipment. With an eye to the future and the world we will leave to our children, the SKF Group policy on environment, health and safety, as well as the manufacturing techniques, are planned and implemented to help protect and preserve the earth's limited natural resources. We remain committed to sustainable, environmentally responsible growth.

Principles of actuator and pillar selection and application

Linear actuator definition and type

Definition: Electro-mechanical linear actuators enable precise, controlled, and repeatable push/pull movement in linear drive applications (see illustrations below).

Linear actuators serve as efficient, virtually maintenance-free, and environmentally friendly alternatives to hydraulic or pneumatic types.

Standard versions can handle loads as great as 12 kN, deliver speeds up to 150 mm/s, and travel as far as 1 500 mm. They can be self-contained in aluminum,

zinc, or polymer housings and ready-to-mount for easy plug-in operation.

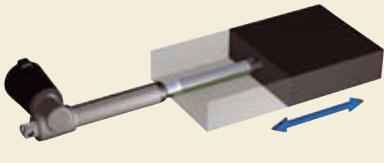

Actuators with modular design and open architecture offer opportunities to choose and integrate components to achieve customized solutions within existing envelopes. Application potential expands with the introduction of technologies for specific purposes, such as hall sensors, limit switches, potentiometers, friction clutches, or back-up nuts.

Screw-type linear actuators powered by an electric AC or DC motor basically consist of a lead screw (threaded shaft/spindle) with drive nut and push tube. In 90 % of the ca-

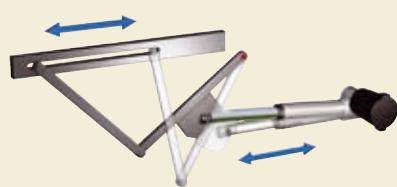

ses, a gearbox between the motor and the screw is also present.

When power is supplied, the motor rotates the lead screw, which causes the drive nut to travel and extend the push tube. Reversing the motor rotation retracts the push tube.

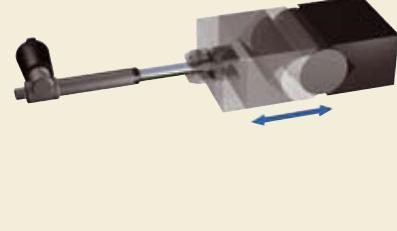

Pushing/pulling

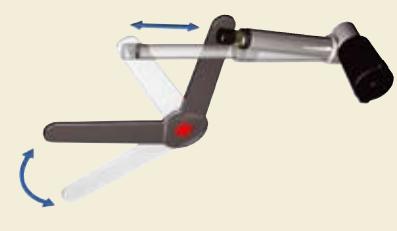

Opening/closing

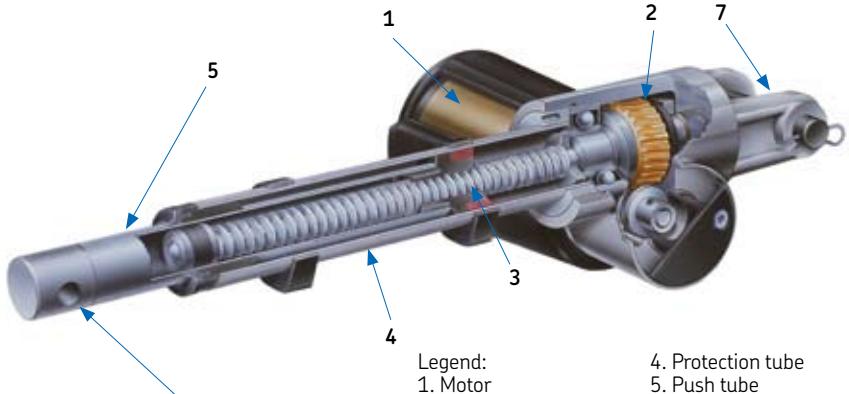

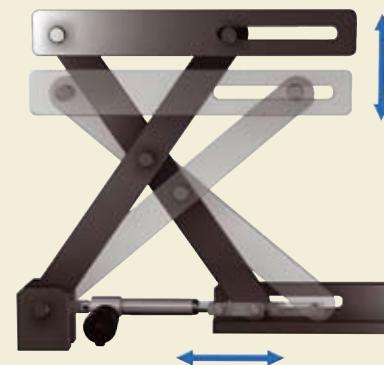

Clamping/gripping

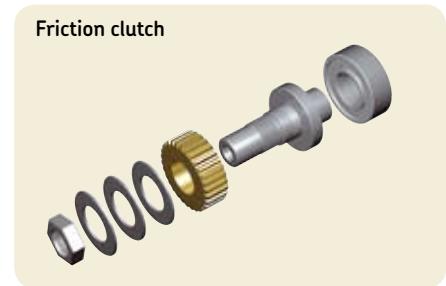

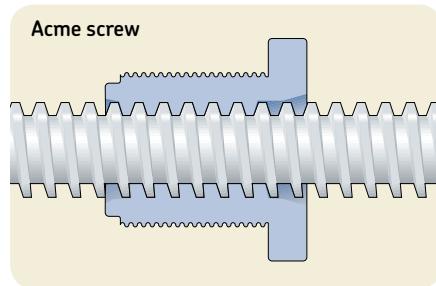

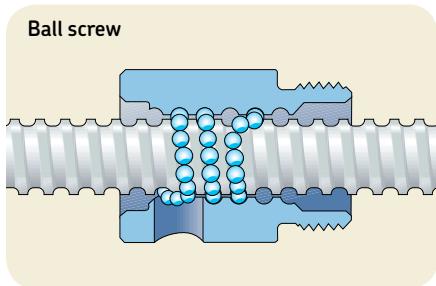

Tilting

Raising/lowering

Ball screw vs. acme screw: Traditional types of lead screws include ball screws and acme screws, whose specification will be influenced by an actuator's configuration and load requirements.

Ball screws: All-steel ball screws consist of a screw shaft, ball nut with a ball recirculation system to convert rotary motion into smooth, accurate, and reversible linear motion (or torque to thrust). The row of circular rolling elements is self-contained in a closed system between the nut and screw for a design exhibiting extremely low friction coefficients. The low frictional resistance minimizes wear, improves efficiency, and reduces operating temperature for longer service life.

Ball screws can handle extreme loads, achieve high duty cycles, operate over a wide temperature range, and deliver the precision necessary to equip actuators performing over long periods at high speeds and requiring high dynamic capability. Brakes usually will be specified for ball screw actuators to prevent back-drive.

Acme screws: These screws transmit torque into linear motion through direct sliding friction. A typical assembly consists of a steel screw and plastic nut.

Some of the products are equipped with acme screws with a relatively high friction coefficient that makes them well suited for self-locking application. Acme screw actuators accommodate high static load, withstand excessive vibration, operate quietly, and represent cost-effective solutions.

bling technologies have been developed for these purposes.

Limit switch: Its purpose is to limit actuator motion or travel in a particular direction. When activated, the switch opens or closes an electrical contact. When the contact is closed, current will flow through the switch; when the contact is open, no current will flow through the switch. These devices prevent actuators from running into the mechanical ends and may allow for the adjustment of stroke length.

Hall sensors: These rotary or linear sensing devices determine the relative position of an actuator. Two sensors detect the changing magnetic field created by a rotating magnet and then relay corresponding output pulses to a control unit to provide the position feedback.

Potentiometer: A potentiometer is an analogue feedback device. The potentiometer is considered as an absolute sensor with unique value in each position. Sometimes it is called a variable resistance that can be read and feed into a controller for positioning control of the application.

Friction clutch: This function will protect the actuator from mechanical damage when it reaches either of its mechanical end positions or when the maximum dynamic load is momentarily exceeded. A friction clutch consists of a series of steel plates engaging a hub and a series of friction rings engaging a housing. Pressure is exerted on the plates and rings by an adjuster acting through a spring and pressure plate. The friction clutch is not intended for use as a load limiter, but only for protection of the actuator and end-use equipment in the event of dynamic overload.

Ball detent clutch: A ball detent type clutch transmits force through hardened balls which rest in detents on the shaft and are held in place with springs. An overtorque/load condition pushes the balls out of their detents, thereby decoupling the lead-screw from the motor.

Back-up nut: This prevents an actuator from collapsing if a drive nut fails. The back-up nut is usually in metal, exhibits greater anti-shear strength than the drive nut, and only makes contact with the threads of the spindle when the threads of the drive nut fail. The back-up nut carries the load and may be able to lower the load (signaling need for repair).

Slip stick effect: The cycle of alternating slipping and sticking as two surfaces rub against each other. The effect is vibration and noise. Resonances within other materials can occur. This effect can sometimes be heard, felt or seen. With linear actuators, Slip stick has been witnessed between the Delrin and aluminum or steel, such as between drive nut and spindle, and glide pad and extrusion.

Performance considerations

Beyond the basic fundamentals of actuator operation, applications may require feedback on position and/or direction, limits on motion or travel in a particular direction, or protection against dynamic overload. En-

Selection criteria

An actuator's performance will be influenced by a variety of factors intrinsic to an application. An understanding of these factors can help you select the most suitable actuator design and solution. Relevant factors to evaluate include push/pull force, static and dynamic load capacity, speed, stroke and retracted length, duty cycle, and life calculation.

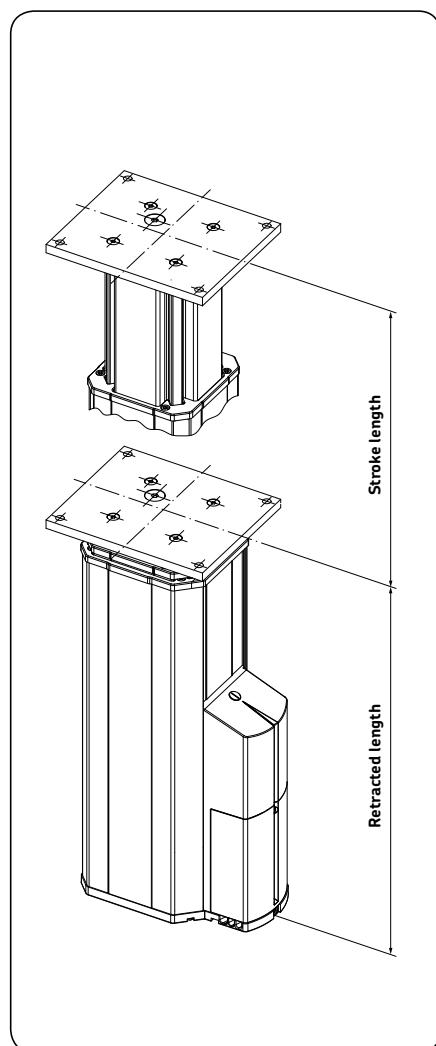

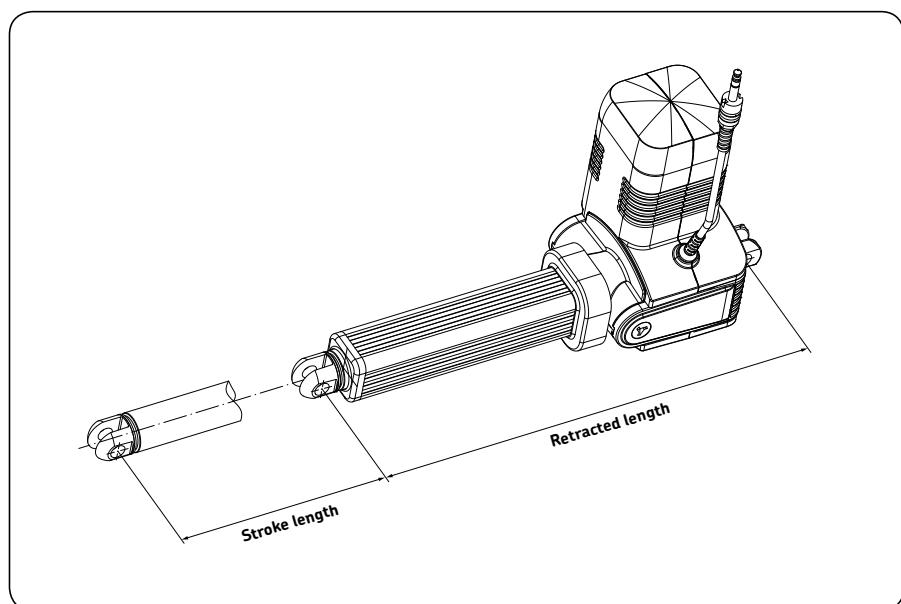

Force: Push force is the maximum extending force that an electric linear actuator can produce in Newtons (N). Pull force is the maximum retracting force. Some actuators do not produce equal push and pull forces, while others do not permit pull force.

Load capacity: Maximum static load refers to the weight or mass that an actuator can handle when standing still without causing permanent damage or causing the actuator to start "going backwards." (Subjecting an actuator to loads in excess of stated values can increase the risk of permanent deformation to some parts.) Maximum dynamic

load represents the maximum total weight or mass that the actuator can move. The decisive factor for this value is the size of the motor and the type of gearing. Some versions feature an integral mechanical safety device similar to a clutch to protect the motor and gears from damage.

Speed: This represents the rate of travel (when extending or retracting) and is usually measured in mm/s or in./s. Speed can vary under different loads, often depending on the motor. Actuators with DC motors exhibit a speed variation inversely proportional to the load. Actuators with AC motors move at more consistent speed, which is only slightly affected by the load. Other factors impacting the speed will include the magnitude and/or frequency of the applied voltage, the ambient temperature, and how well an actuator is integrated into the end-use application.

Stroke and retracted length: The stroke describes the length (in millimeters or inches) that an electro-mechanical linear actuator or telescopic pillar will extend or retract. The retracted length is the shortest distance between the two fixed points on an actuator when the actuator is in its innermost position. The dimensions reflect a measurement from the center of the rear and front mounting holes.

Calculations

Duty cycle and duty factor: This defines the maximum period during actuator operation without interruption. The corollary duty factor expresses how long an actuator can handle non-stop operation before it overheats or is otherwise damaged. Many variables will affect the duty cycle, including running time, application, design, installation, and components. It is necessary for you to assess the type of task, its duration, frequency, and repetitiveness when evaluating expected duty cycle.

SKF linear actuators are designed for intermittent operation. Permitted load is related to the duty factor i.e. load must be reduced, when the duty factor is increased. Duty cycle is defined as the relation between operational time, load and rest time. In the diagrams, maximum load is shown as a function of duty cycle. If the recommended duty factor is exceeded, the actuator may overheat and be damaged.

Permitted load for DC-actuators at a specific duty factor is expressed in percentage of maximum dynamic load capacity (→ fig. 1).

$$\text{Duty factor \%} = \frac{N}{N+R} \cdot 100$$

where

N = running period under load

R = rest period

N+R = total cycle time

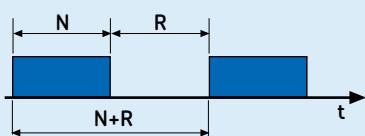

Fig. 1

Example:

An actuator is running with the following cycle, 5 seconds running, 5 seconds rest, 5 seconds running, 15 seconds rest, and so on.

Calculate duty factor and maximum load for this working cycle.

$$\text{Duty factor} = \frac{5+5}{(5+5)+(5+15)} \cdot 100 = 33\%$$

Max. dynamic load = 5 000 N

Permitted load = $0,73 \times 5\,000 = 3\,650$ N

Life calculation: An actuator's life expectancy is divided into two types: its life and its service (or operational) life. The actuator's life is defined as the time the actuator can live without being derated due to age. The actuator's service life is defined as the time (or how many cycles) the actuator can operate. For example, an actuator is installed to operate once a day for 10 years. Its expected life is 10 years and its required service life is 10×365 cycles.

The service life of a ball screw actuator normally will be determined by the L_{10} life of the ball screw. In most cases, there is less wear on the worm gear and bearings than on the ball screw.

Under certain circumstances, the life of the motor is shorter than that of the ball screw. Generally, the life of DC-motors is reduced when load and number of starts/stops are increased.

To calculate the basic rating life L_{10} of a ball screw, all you need to know is the dynamic load and actual stroke. L_{10} is defined as the life that 90% of a sufficiently large group of apparently identical ball screws can be expected to attain or exceed.

$$L_{10ds} = \frac{500\,000\,p}{S} \left(\frac{C}{F_M} \right)^3$$

where

L_{10ds} = basic rating life in double strokes
i.e. a stroke from one end position to the other and back again.

p = lead of the ball screw (mm).

S = actual stroke (mm).

C = ball screw basic dynamic load rating (N).

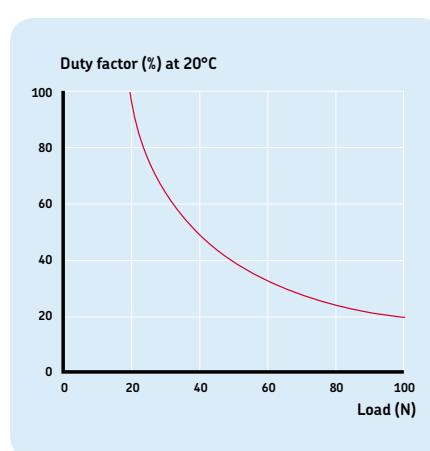

F_M = cubic mean load (N).

In many cases, the magnitude of the load fluctuates. In order to calculate the equivalent screw load, it is first necessary to determine a constant mean load F_m which would have the same influence on the ball screw as the actually fluctuating load. A constant mean load can be obtained from the formula below.

$$F_M = \sqrt[3]{\frac{F_1^3 S_1 + F_2^3 S_2 + F_3^3 S_3 + \dots}{S_1 + S_2 + S_3 + \dots}}$$

Example:

An actuator with a stroke of 500 mm has a load of 2 800 N in one direction of movement and 2 100 N in the other. The entire stroke of the actuator is utilized.

$$F_M = \sqrt[3]{\frac{2\,800^3 \times 500 + 2\,100^3 \times 500}{500 + 500}} = 2\,500$$

Application checklist

Designing and specifying an electro-mechanical linear actuator begins by assessing as many application factors as possible to make the most appropriate and educated technology choices.

- How much force and in what directions (push, pull, vertical, and/or horizontal) will the actuator need to move?
- How far and how fast will the actuator need to travel?
- How often will the actuator operate and how much time will elapse between operations?
- What is the desired lifetime for the application?
- How will the actuator be mounted and will front and/or back mounts require special configurations?
- Does the application suggest a need for safety mechanisms?
- Will environmental factors (temperature variations, moisture, or vibration) pose a challenge to operation?
- Is space limited?
- What are the power supply options?
- If a motor is used, what type (AC, DC, or special) and what voltage?
- Is feedback required for speed and/or position?
- Are revised specifications likely or anticipated in the future?

Typical applications

Linear actuator CAHB-31 series

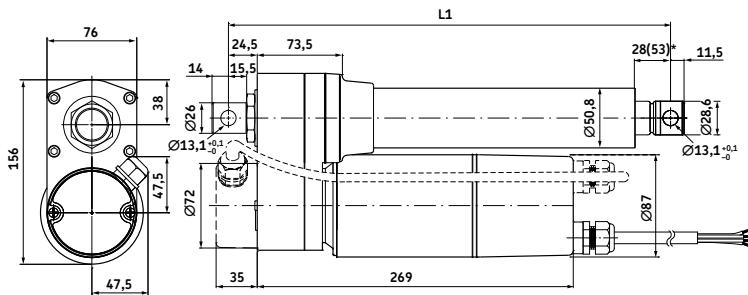

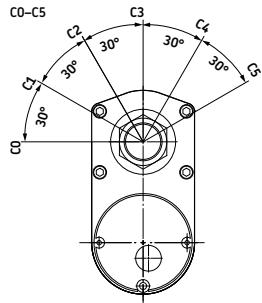

Benefits

- High efficiency ball screw
- Extension tube (stainless steel)
- Protection tube (steel)
- Enhanced corrosion resistance
- Mechanical overload protection (clutch)
- Lubricated for service life
- Robust, designed for tough environment
- No back driving
- Motor with thermal protection

Linear actuator SJ 25, 35, 45 series

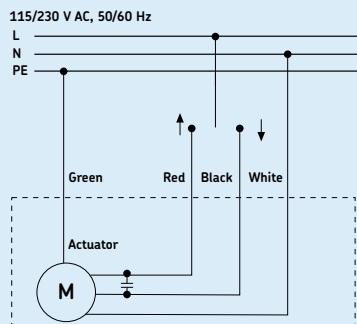

Benefits

- Motor with thermal protection (+120± 5°C)
- Acme screw
- Self-locking
- Integrated limit switches
- Potentiometer for feedback
- Gear box (metal)
- UL 1004/UL 60601-1* certification

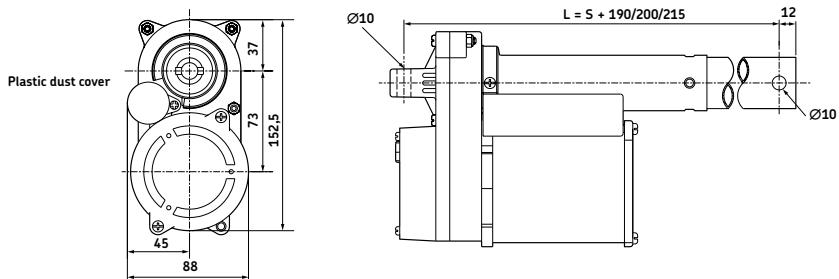

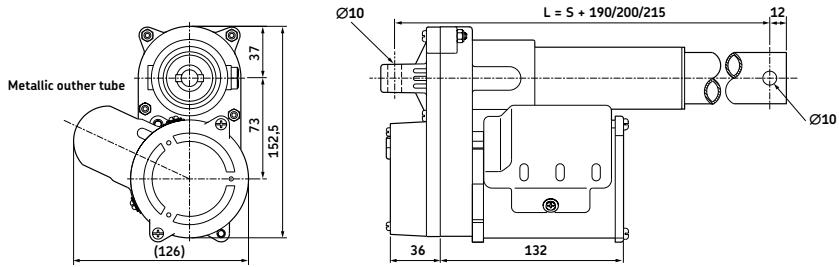

* Only as an option for SJ35 and SJ45

Linear actuator CAHB–30 series

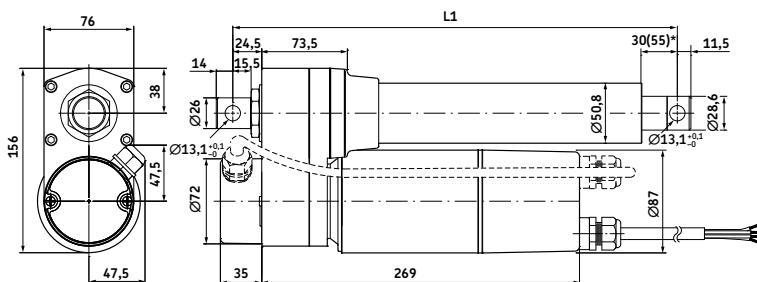

Benefits

- ACME screw drive
- Extension tube (stainless steel)
- Protection tube (steel)
- Enhanced corrosion resistance
- Mechanical overload protection (clutch)
- Lubricated for service life
- Robust, designed for tough environment
- Self-locking
- Motor with thermal protection

Linear actuator FD series

Benefits

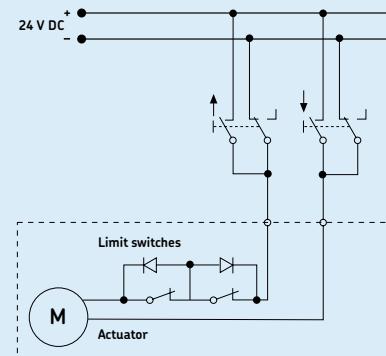

- Cost-effective actuator
- Hall effect sensors for feedback
- Rear clevis can be turned per step of 30°
- Built-in limit switches (factory pre-set)
- UL 1004 certification

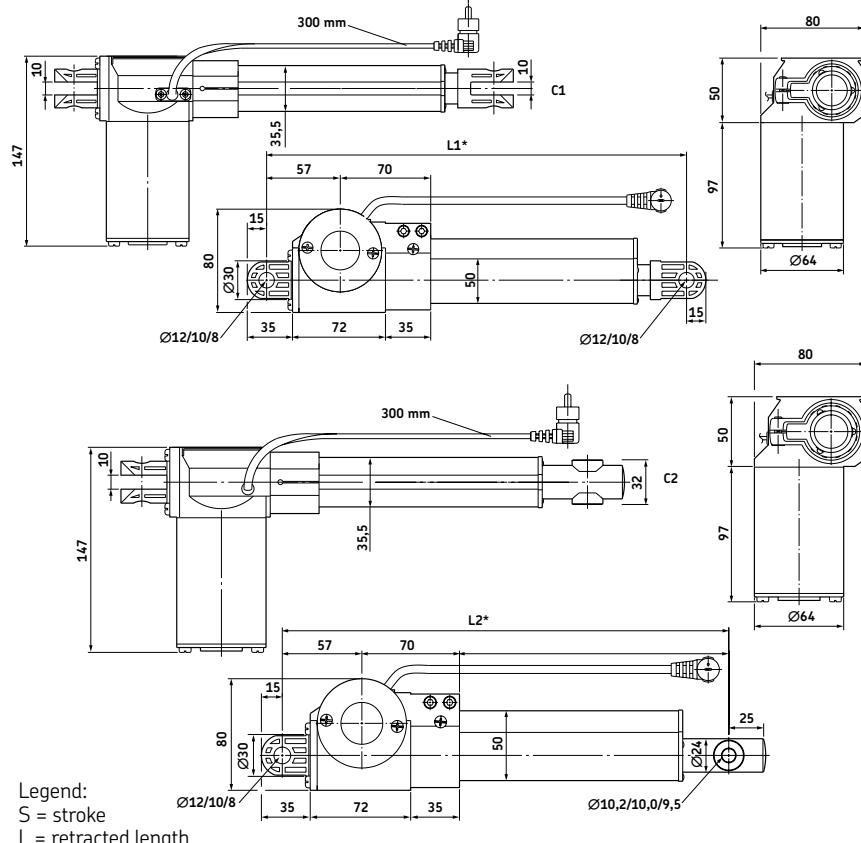

Suitable control units and accessories

Linear actuator CAHB-21 series

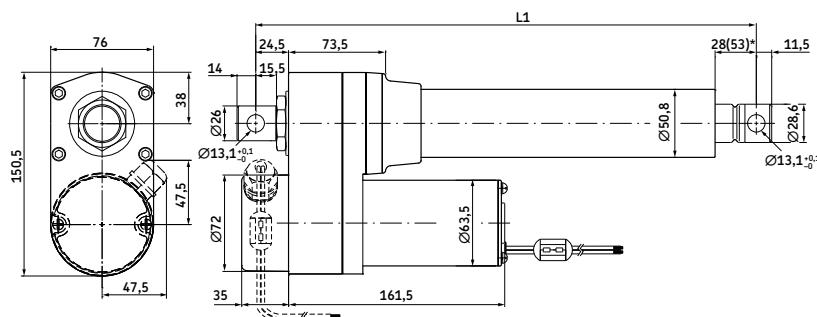

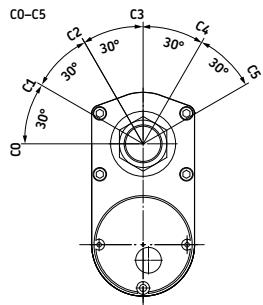

Benefits

- High efficiency ball screw
- Extension tube (stainless steel)
- Protection tube (steel)
- Enhanced corrosion resistance
- Mechanical overload protection (clutch)
- Lubricated for service life
- Robust, designed for tough environment
- No back driving
- Certified (CE: EN 55011)

Linear actuator CAHB–20 series

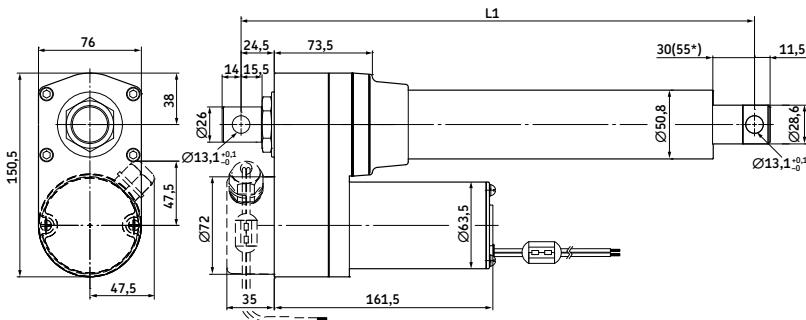

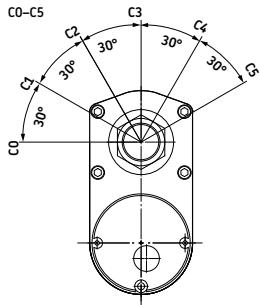

Benefits

- ACME screw drive
- Extension tube (stainless steel)
- Protection tube (steel)
- Enhanced corrosion resistance
- Mechanical overload protection (clutch)
- Lubricated for service life
- Robust, designed for tough environment
- Self-locking
- Certified (CE: EN 55011)

Linear actuator CAT 21B

Benefits

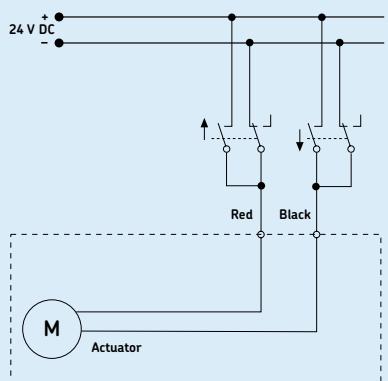

- Compact design (efficient and cost effective)
- Ball screw technology
- High operating reliability
- Low energy consumption
- Lubricated for service life
- Corrosion resistant
- Silent operation
- Range of front and rear attachments

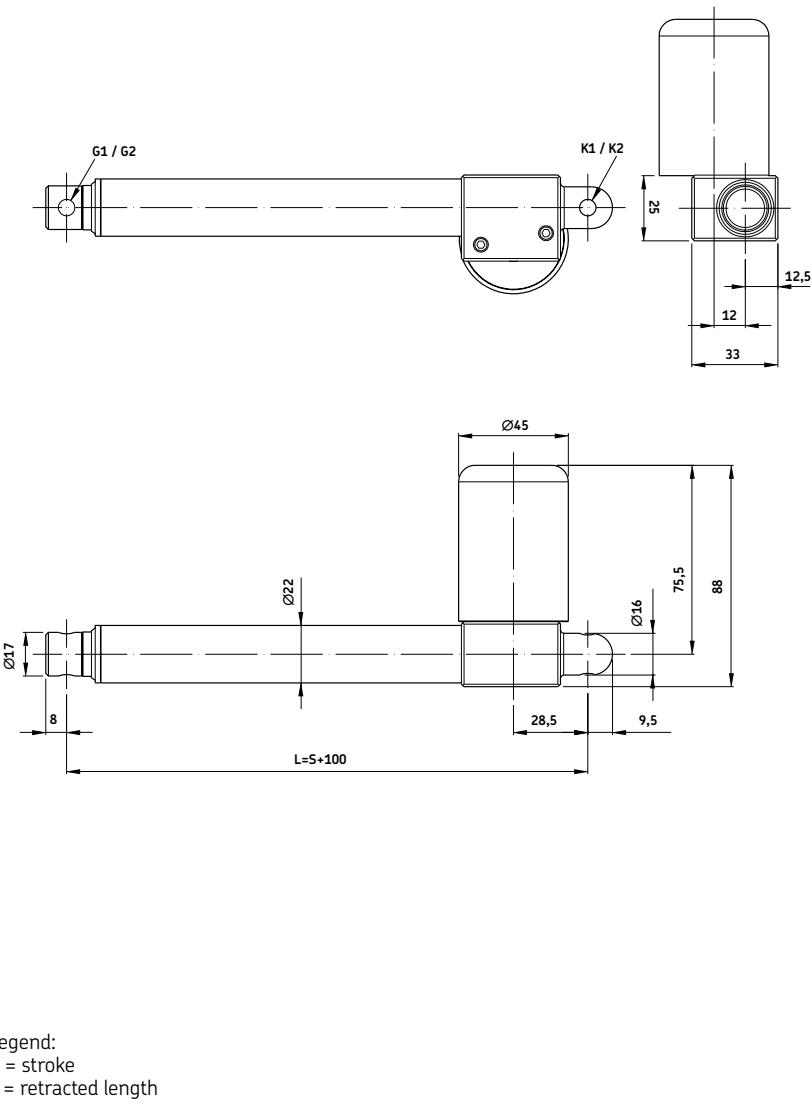

Suitable control units and accessories

* TLT is a 2-motor actuator. If simultaneous run is needed, VCP21-CC... is recommended

Control unit BCU

Benefits

- Compact 3-channel actuator control unit
- Single fault safety
- Overload and over-temperature protection
- Approved for medical applications
- Easy to clean
- Low standby current

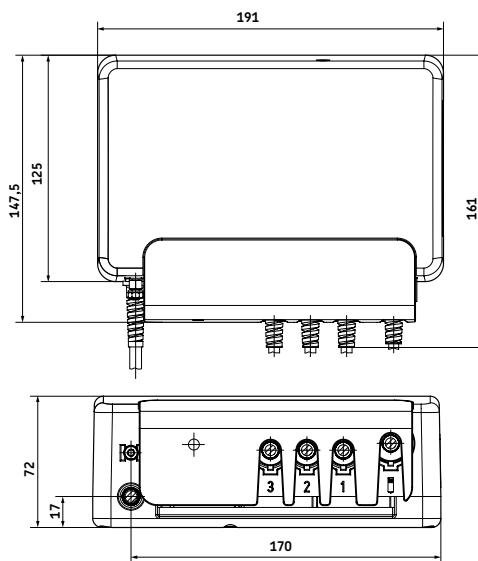

Suitable actuators, pillars and accessories

¹⁾ Peak force to be used only in static phases. For dynamic ones, this value must be limited inside the motion controller at 80 % of the dynamic load by the user. Please contact SKF.²⁾ Maximum speed. This value must be limited inside the motion controller by the user. Please contact SKF.

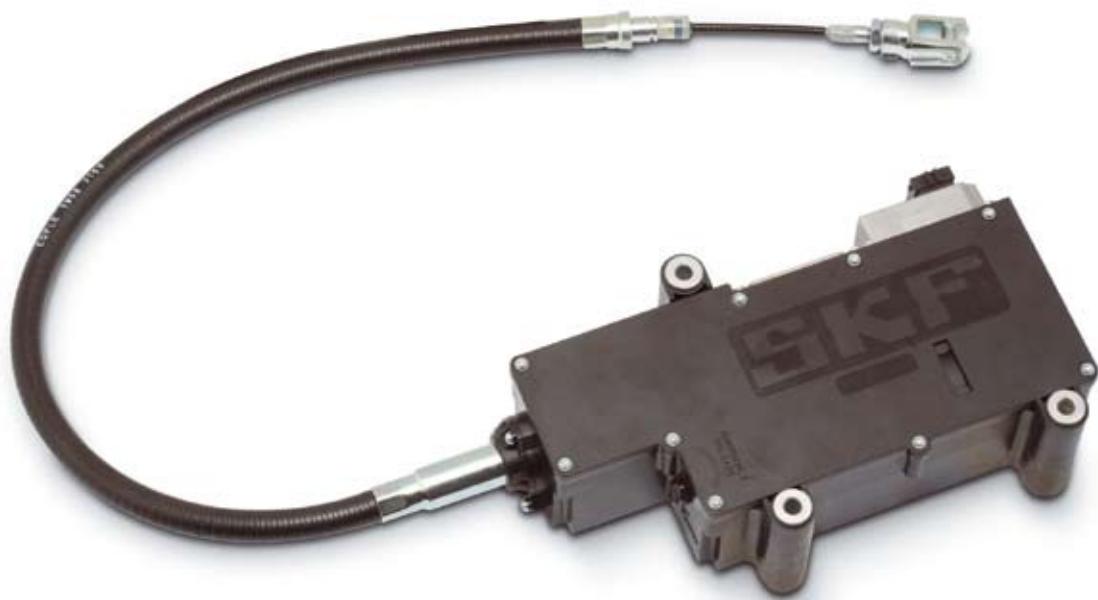

Drive by wire

Electronic Parking Brake EPB.....366

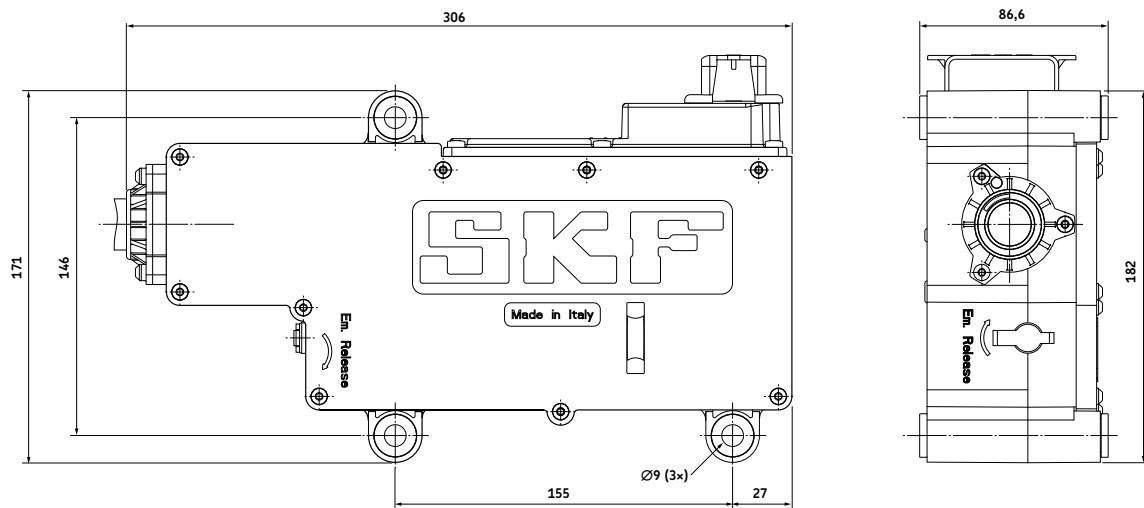

Electronic cable puller actuator for off-highway vehicles

Benefits

- Easy to install
- Compact
- Eco-friendly solution
- Enhanced comfort and safety for user

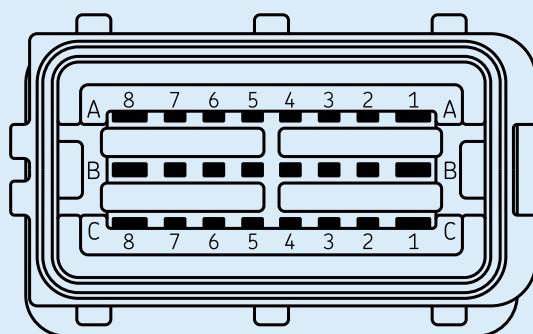

Dimensional drawing

Technical data

| | Unit | ADW-0000 |
|---|----------------------|-------------|
| Max force | N | 4 000 |
| Stroke | mm | 65 |
| Max speed (without load) | mm/s | 18 |
| Endurance | Apply/release cycles | 170 000 |
| Supply voltage at full performance (range) | V | 11,5 to 16 |
| Supply voltage at longer apply/release time (range) | V | 10 to 11,5 |
| Supply voltage at electronics full active (range) | V | 9 to 16 |
| Max current consumption (during actuations) | A | 30 |
| Max current consumption (only electronics) | A | 0,2 |
| Ambient temperature | °C | -40 to + 85 |
| Humidity | % | 20 to 80 |
| Protection class | IP | 67 |
| Weight (without bowden cable) | kg | 3 |

CAXC 33 limit switch

Limit switches, combined with SKF control units, make it possible to set the stroke to any desired length.

- CAXC 33 – designed for the following actuators:
CAT 33
CALA 36A
CARE 33A
CARE 33M
- Two CAXC needed for inner and outer limit
- Use of limit switches reduce the effective stroke by 20 mm (retracted position is affected)

Connecting diagram**Technical data**

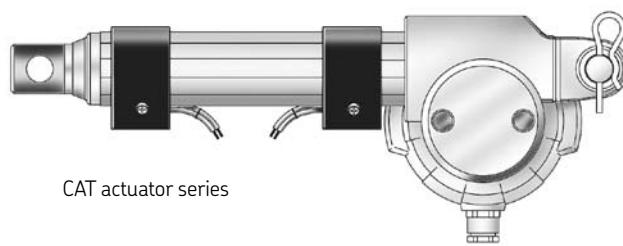

Permissible power: 3 W
Max. DC voltage: 200 V
Max. DC current: 200 mA

Ordering code

CAXC 33

NB! One CAXC is needed for each limit position.

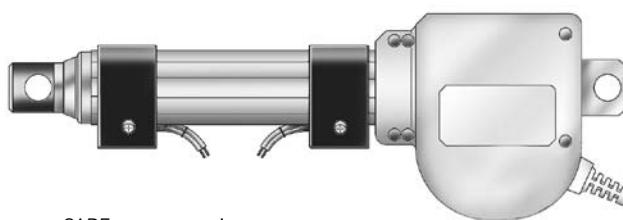

NB! Make sure you connect limit switches to a DC-supply.

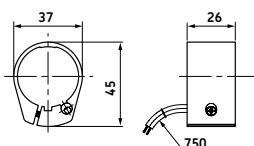

CAT actuator series

CALA actuator series

CARE actuator series

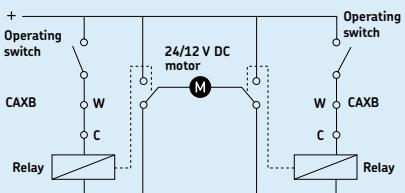

W = Common
C = Normally closed
O = Normally opened

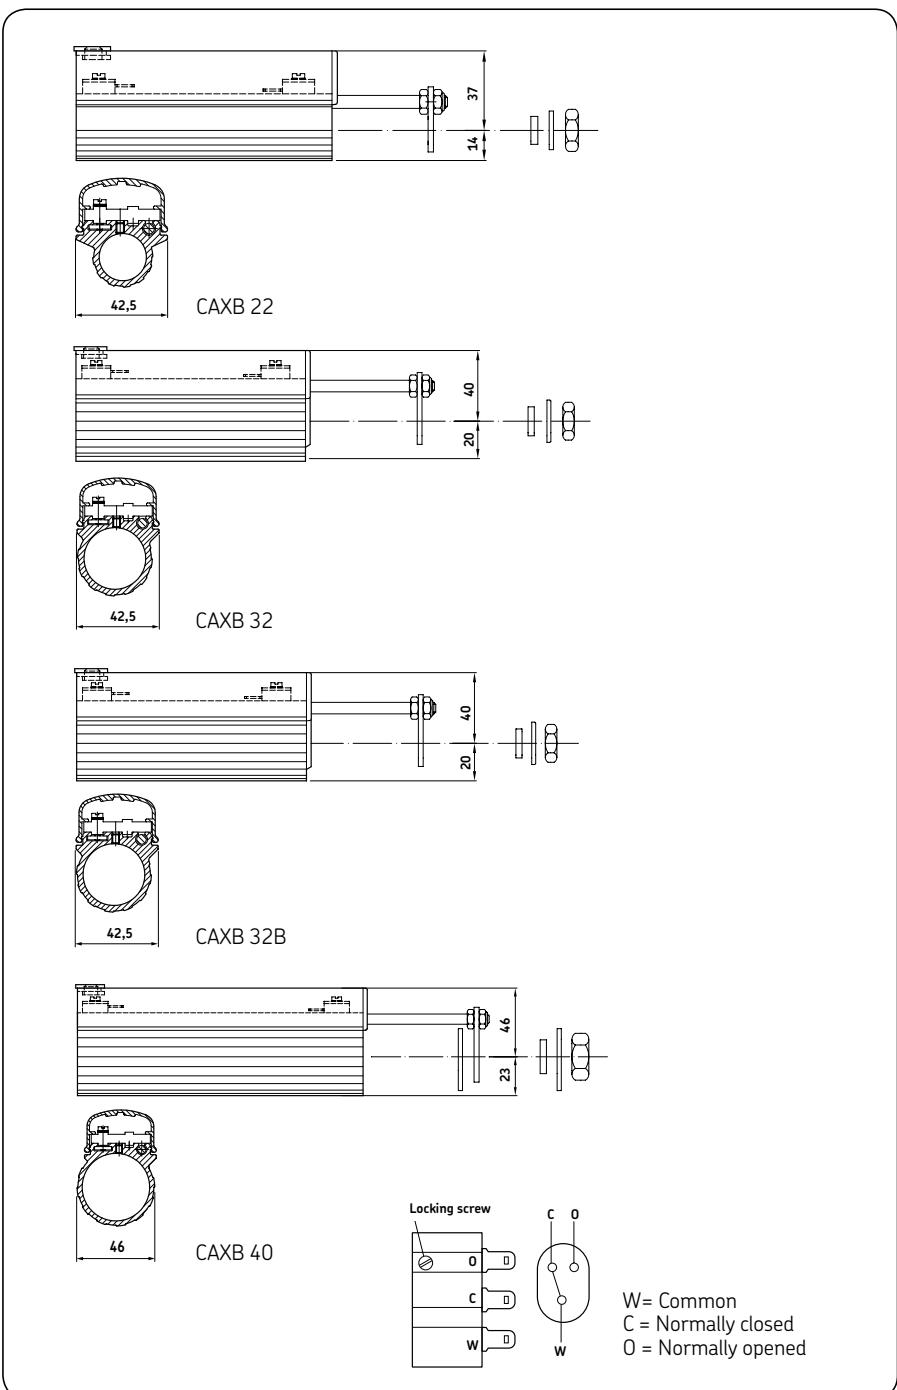

CAXB limit switch

Limit switches, combined with SKF control units, make it possible to set the stroke to any desired length.

- CAXB - designed for the following actuators:
CAR 22
CAR 32
CAR 40
CAT 32B
CARN 32
- To avoid running into mechanical end stop, the limit switches should be located approximately 10 mm from its respective end stop
- Front attachment G3 must be selected for this option

Connecting diagram**Technical data**

Permissible power: 3 W
Max. DC voltage: 200 V
Max. DC current: 200 mA

Encoder E2

- Can be fitted to all standard motors
- Hall effect, two channels with 90° displacement
- Located on gear housing, see drawing
- 2 pulses/channel and motor revolution
- Supply voltage: 5–24 V DC
- Final resolution according to gear ratio and actuator basic type (see table)

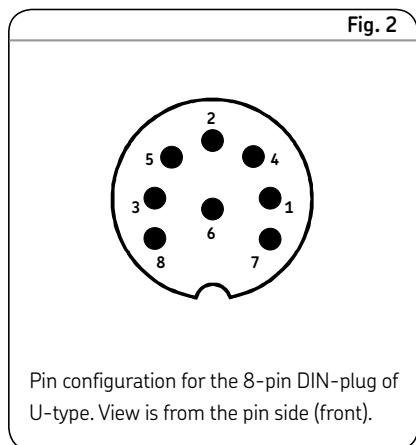

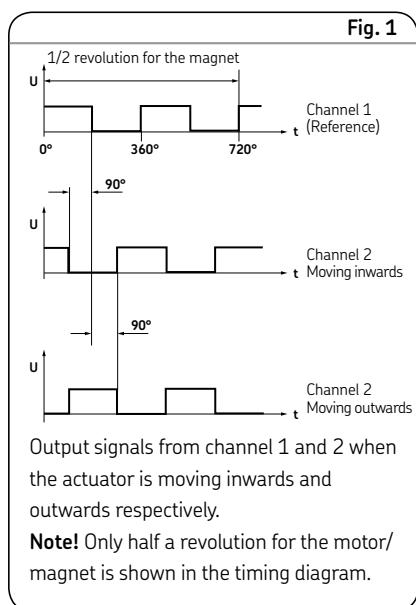

Feedback

| | Gear | Pulses at 1mm stroke | Resolution (mm) per pulse |
|---------|------|----------------------|---------------------------|
| CAT 33 | 1 | 16,67 | 0,06 |
| | 2 | 8,33 | 0,12 |
| | 4 | 4,17 | 0,24 |
| CAT 33H | 1 | 4,00 | 0,25 |
| | 2 | 2,00 | 0,50 |
| | 4 | 1,00 | 1,00 |
| CAT 32B | 1 | 12,50 | 0,08 |
| | 2 | 6,25 | 0,16 |
| | 4 | 3,13 | 0,32 |

Encoder option E2

2-Hall encoder

| Actuator version | Resolution/pulse |
|------------------|------------------|
| CARE 33A | 0,75 mm |
| CARE 33H | 3,175 mm |
| CARE 33M | 1,50 mm |

Table 2. Movement resolution.

| Pin no | Color | Function |
|--------|--------|----------------------------|
| 1 | Green | Motor supply voltage + |
| 2 | Red | Motor supply voltage - |
| 3 | Black | Encoder supply voltage VCC |
| 4 | Red | Motor supply voltage - |
| 5 | Brown | Encoder supply voltage GND |
| 6 | White | Output channel 2 |
| 7 | Green | Motor supply voltage + |
| 8 | Violet | Output channel 1 |

Table 3. Interface for the 8-pin DIN-plug. See figure 2 for pin configuration. Motor's voltage polarity is stated for outward movement.

| Parameter | Value |
|-------------------------------|------------------------|
| Supply voltage range (VCC) | min 4,5 to max 24 V DC |
| Max continuous output current | 22 mA (open collector) |
| Temperature range °C | -20 to +70 |

Table 1. Recommended operating ratings.

Notes

A large, empty grid of blue lines on a white background. The grid consists of approximately 20 horizontal rows and 20 vertical columns, creating a pattern of small squares. It is enclosed within a thin black border.
