

# SKF FX Keyless Bushings

# Contents

The SKF brand now stands for more than ever before, and means more to you as a valued customer.

While SKF maintains its leadership as a high-quality bearing manufacturer throughout the world, new dimensions in technical advances, product support and services have evolved SKF into a truly solutions-oriented supplier, creating greater value for customers.

These solutions enable customers to improve productivity, not only with breakthrough application-specific products, but also through leading-edge design simulation tools and consultancy services, plant asset efficiency maintenance programmes, and the industry's most advanced supply management techniques.

The SKF brand still stands for the very best in rolling bearings, but it now stands for much more.

# SKF FX Keyless Bushings

## Introduction

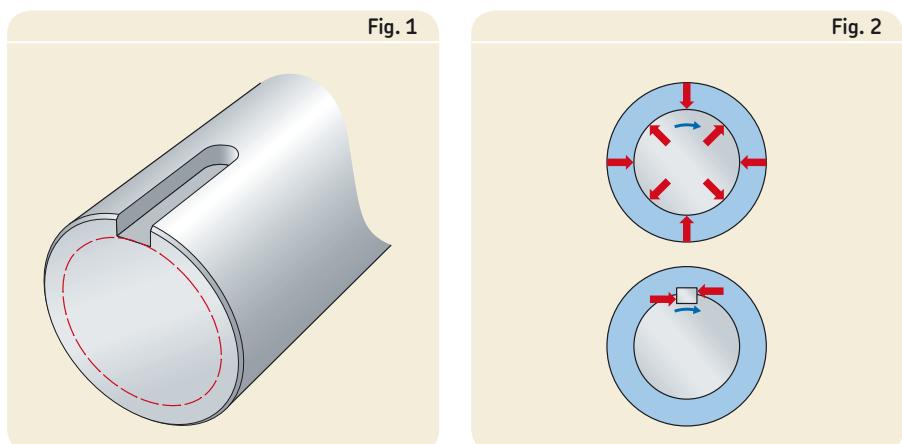

SKF FX Keyless Bushings are designed to secure gears, couplings and pulleys to a shaft using mechanical friction rather than using traditional keyways, splines or an interference fit. In general, the size of a shaft is dependant on a number of factors. If splines or keyways are cut into a shaft, the shaft is weakened and a larger-than-necessary shaft must be specified. If, however, the objective is to reduce shaft size, weight, machining costs and installation time while improving accuracy and reliability, SKF FX Keyless Bushings are an excellent solution.

SKF FX Keyless Bushings are available in 16 different designs, enabling machine designers to match the best bushing solution to the application. The bushings, which are made from high quality steel, meet SKF standards for precision and quality.

SKF FX Keyless Bushings are designed to accurately and effectively mount components to a shaft. These components, which normally require sophisticated broaching or milling techniques to prepare the shaft, can now be mounted with a minimum amount of machining. This not only saves time, it can also significantly reduce production costs.

In the past, the torque capacity of an application was limited by the keyway, spline or interference fit. The use of keyways meant that over-designed shafts were used to accomodate the structural loss of strength (→ fig. 1). As a consequence, shaft costs increased considerably.

However, SKF FX Keyless Bushings have changed that by placing torque limits on the design of the hub and material of the shaft.

*For keyed bushings, the shaft diameters need to be increased by 20–30% to cover the expected weakening caused by the keyways*

*Traditional connections*

## Traditional connections

Traditional connections include interference fits (also called press fits and shrink fits) keyways, keyed bushing systems, QD and tapered bushings (→ fig. 2).

Interference fits offer some advantages, like zero backlash and uniform contact pressures. Interference fits also have distinct disadvantages such as extended fit lengths and the need for extremely close machining tolerances of the shaft and component bore. Also, depending on the size of the shaft, the use of a press or heat source might be necessary. In addition, maintenance is often difficult and components can seldom be reused.

Keys and keyways have been around for quite some time and keyed tapered bushings are especially popular around the globe as the same basic bushing can be accommodated on different shaft sizes. Keys and keyways are relatively easy to prepare, quick to install and provide a low cost solution. Although

they are commonly used, they are surprisingly ineffective. When keyways are cut into components and shafts, they reduce the cross section and, consequently, the strength of the machined parts. As a result, any shafts, gears or pulleys containing a keyway must be oversized to compensate for the reduced cross section. Keys and keyways require a clearance fit on several planes. The combined effect of these clearances is backlash, which in some cases can enlarge the keyways, while promoting fatigue failures and fretting corrosion.

# About SKF FX Keyless Bushings

SKF FX Keyless Bushings are designed to create an interference fit with uniform contact pressure on shafts and components that must be fixed to the shaft. The design offers true zero backlash installation and has none of the problems associated with keyways. SKF FX Keyless Bushings make it easy to mount components with a cylindrical (non-tapered) bore to standard, plain shafting and can even be mounted over an existing keyway if necessary.

These bushings, which can accommodate wide component tolerances, can considerably reduce machining and material costs.

In addition, SKF FX Keyless Bushings are easy to adjust axially and radially, and are simple to install and remove.

## A truly innovative concentric locking technology

The concept behind SKF FX Keyless Bushings is based on two inclined planes working against each other. As a series of screws or a single hexagonal nut is tightened, two steel rings with inclined serrations are displaced axially. This forces one steel ring to expand in the component bore while the other ring contracts evenly around the shaft. The result is a true concentric, tight fit.

The near perfect 360 degree grip on the shaft and in the component bore eliminates shaft damage and the possibility of fretting corrosion.

## Shape factor based on installation setup

## Minimum hub diameter calculation

SKF FX Keyless Bushings use opposing inclined planes to apply pressure on a shaft and hub. This pressure can be quite significant and could exceed the material strength of the hub and shaft. The shaft values are only critical if the shaft is hollow, but, in all cases, the forces on the hub must be calculated.

When calculating the minimum hub diameter, the length and shape of a hub influences the results. The data required to calculate the minimum hub diameter are:

- The hub surface pressure from the product tables for each size
- Select the shape factor based on the installation setup (**→ fig. 3**)
- The hub material yield strength (**→ table 1**)

To calculate the required minimum hub diameter for each application, follow the example below.

### Example

With an application using a selected model PHF FX10-50X80. From the product table, the listed hub surface pressure ( $P_n$  N/mm $^2$ ) is 115 N/mm $^2$ .

- This bushing requires a centering hub (**→ fig. 3**), Shape factor  $f = 0,8$ .
- The hub, made from mild steel, has a material yield strength of 220 N/mm $^2$  (**→ table 1**).
- From **table 2**, we can determine the factor for the ratio to be applied to the hub diameter 1,56, which has to be multiplied by D.
- The minimum hub diameter is  $80 \text{ mm} \times 1,56 = 124,8 \text{ mm}$  for full power transmission capability.

Table 1

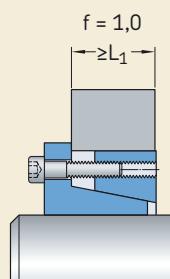

### Material yield strength values

Yield strength Material

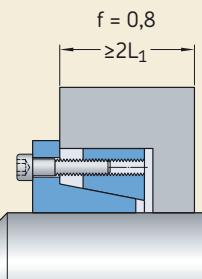

N/mm $^2$  –

180	Cast iron
600	SG iron
220	Mild steel
550	Gear steel
195–225	18/8 Austenitic stainless steel
565–608	Cast steels 0,3% carbon
95–125	Aluminium
180	Aluminium alloy Hs 30W
415	4,5% Cu – Aluminium alloy

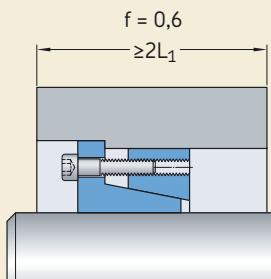

Fig. 3

Narrow hubs with length  $\geq L_1$

Wider hubs with centering guides,  
length  $\geq 2L_1$

Wider hubs without centering guides,  
length  $\geq 2L_1$

# SKF – the knowledge engineering company

From the company that invented the self-aligning ball bearing more than 100 years ago, SKF has evolved into a knowledge engineering company that is able to draw on five technology platforms to create unique solutions for its customers. These platforms include bearings, bearing units and seals, of course, but extend to other areas including: lubricants and lubrication systems, critical for long bearing life in many applications; mechatronics that combine mechanical and electronics knowledge into systems for more effective linear motion and sensorized solutions; and a full range of services, from design and logistics support to condition monitoring and reliability systems.

Though the scope has broadened, SKF continues to maintain the world's leadership in the design, manufacture and marketing of rolling bearings, as well as complementary products such as radial seals. SKF also holds an increasingly important position in the market for linear motion products, high-precision aerospace bearings, machine tool spindles and plant maintenance services.

The SKF Group is globally certified to ISO 14001, the international standard for environmental management, as well as OHSAS 18001, the health and safety management standard. Individual divisions have been approved for quality certification in accordance with ISO 9001 and other customer specific requirements.

With over 100 manufacturing sites worldwide and sales companies in 70 countries, SKF is a truly international corporation. In addition, our distributors and dealers in some 15 000 locations around the world, an e-business marketplace and a global distribution system put SKF close to customers for the supply of both products and services. In essence, SKF solutions are available wherever and whenever customers need them. Overall, the SKF brand and the corporation are stronger than ever. As the knowledge engineering company, we stand ready to serve you with world-class product competencies, intellectual resources, and the vision to help you succeed.

## Evolving by-wire technology

SKF has a unique expertise in the fast-growing by-wire technology, from fly-by-wire, to drive-by-wire, to work-by-wire. SKF pioneered practical fly-by-wire technology and is a close working partner with all aerospace industry leaders. As an example, virtually all aircraft of the Airbus design use SKF by-wire systems for cockpit flight control.

SKF is also a leader in automotive by-wire technology, and has partnered with automotive engineers to develop two concept cars, which employ SKF mechatronics for steering and braking. Further by-wire development has led SKF to produce an all-electric forklift truck, which uses mechatronics rather than hydraulics for all controls.

#### **Harnessing wind power**

The growing industry of wind-generated electric power provides a source of clean, green electricity. SKF is working closely with global industry leaders to develop efficient and trouble-free turbines, providing a wide range of large, highly specialized bearings and condition monitoring systems to extend equipment life of wind farms located in even the most remote and inhospitable environments.

#### **Working in extreme environments**

In frigid winters, especially in northern countries, extreme sub-zero temperatures can cause bearings in railway axleboxes to seize due to lubrication starvation. SKF created a new family of synthetic lubricants formulated to retain their lubrication viscosity even at these extreme temperatures. SKF knowledge enables manufacturers and end user customers to overcome the performance issues resulting from extreme temperatures, whether hot or cold. For example, SKF products are at work in diverse environments such as baking ovens and instant freezing in food processing plants.

4

#### **Developing a cleaner cleaner**

The electric motor and its bearings are the heart of many household appliances. SKF works closely with appliance manufacturers to improve their products' performance, cut costs, reduce weight, and reduce energy consumption. A recent example of this cooperation is a new generation of vacuum cleaners with substantially more suction. SKF knowledge in the area of small bearing technology is also applied to manufacturers of power tools and office equipment.

#### **Maintaining a 350 km/h R&D lab**

In addition to SKF's renowned research and development facilities in Europe and the United States, Formula One car racing provides a unique environment for SKF to push the limits of bearing technology. For over 60 years, SKF products, engineering and knowledge have helped make Scuderia Ferrari a formidable force in F1 racing. (The average racing Ferrari utilizes around 150 SKF components.) Lessons learned here are applied to the products we provide to automakers and the aftermarket worldwide.

#### **Delivering Asset Efficiency Optimization**

Through SKF Reliability Systems, SKF provides a comprehensive range of asset efficiency products and services, from condition monitoring hardware and software to maintenance strategies, engineering assistance and machine reliability programmes. To optimize efficiency and boost productivity, some industrial facilities opt for an Integrated Maintenance Solution, in which SKF delivers all services under one fixed-fee, performance-based contract.

#### **Planning for sustainable growth**

By their very nature, bearings make a positive contribution to the natural environment, enabling machinery to operate more efficiently, consume less power, and require less lubrication. By raising the performance bar for our own products, SKF is enabling a new generation of high-efficiency products and equipment. With an eye to the future and the world we will leave to our children, the SKF Group policy on environment, health and safety, as well as the manufacturing techniques, are planned and implemented to help protect and preserve the earth's limited natural resources. We remain committed to sustainable, environmentally responsible growth.
